1. Peak fit parameters of Ti 2p spectrum (Figure 2(b))

Table S1: Peak fit parameters of rutile TiO₂(100) prepared without O₂ during the last annealing step. Measured using a standard X-ray source (excitation energy of 1486.6 eV). BE: binding energy, LW: Lorentzian width, GW: Gaussian width

| FePc/TiO ₂ (100) without O ₂ | D1 (Ti ⁴⁺) | | D2 (Ti ³⁺) | |
|--|------------------------|------------|------------------------|------------|
| | Component1 | Component2 | Component1 | Component2 |
| peak position [BE, eV] | 459.29 464.97 | | 457.34 463.02 | |
| LW [eV] | 1.30 1.94 | | 1.30 1.94 | |
| GW [eV] | 1.23 1.67 | | 1.23 1.67 | |
| rel. area [%] | 76 | | 24 | |

2. Surface sensitivity of Ti 2p spectra

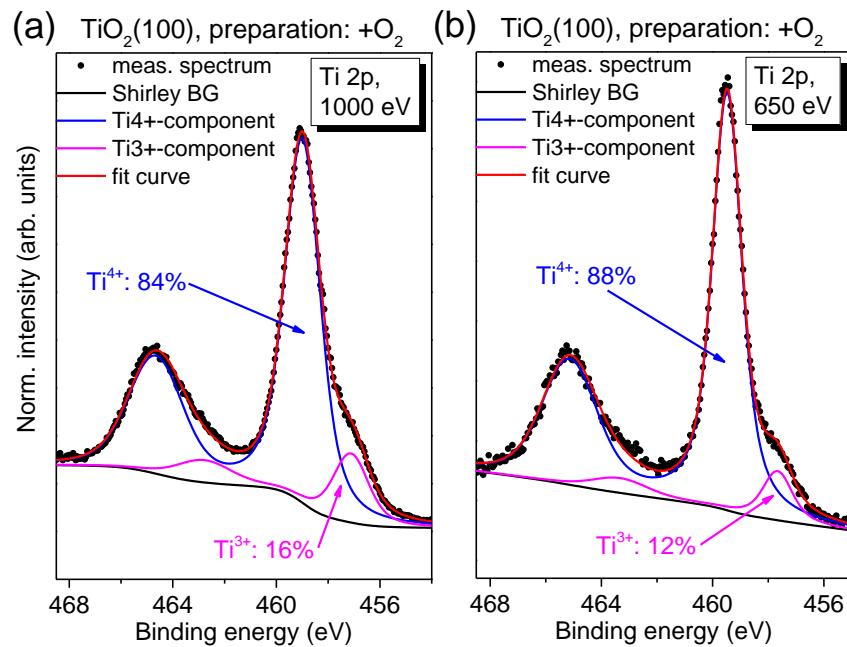

Figure S1: Ti 2p spectra of rutile $\text{TiO}_2(100)$ prepared in an oxygen atmosphere, which are measured with two different excitation energies. (a) 1000 eV, (b) 650 eV. The lower excitation energy is more surface-sensitive. Then, the change in the relative intensity of Ti^{3+} (4%) indicates that the defects are almost evenly distributed with a small preference for the bulk.

Table S2: Peak fit parameters of rutile $\text{TiO}_2(100)$ prepared in presence of O_2 measured with an excitation energy of 1000 eV (Figure S1(a)).

| FePc/ $\text{TiO}_2(100)$ with O_2 , $E_{\text{exc}} = 1000 \text{ eV}$ | D1 (Ti^{4+}) Component1 Component2 | D2 (Ti^{3+}) Component1 Component2 |
|--|---|---|
| peak position [BE, eV] | 458.99 464.66 | 457.12 462.79 |
| LW [eV] | 0.78 0.79 | 0.78 0.79 |
| GW [eV] | 1.16 2.04 | 1.16 2.04 |
| rel. area [%] | 84 | 16 |

Table S3: Peak fit parameters of rutile TiO₂(100) prepared in presence of O₂ measured with an excitation energy of 650 eV (Figure S1(a)).

| FePc/TiO ₂ (100) with O ₂ , E _{exc} = 650 eV | D1 (Ti ⁴⁺) Component1 Component2 | D2 (Ti ³⁺) Component1 Component2 |
|---|--|--|
| peak position | 459.47 | 457.71 |
| [BE, eV] | 465.14 | 463.38 |
| LW [eV] | 0.68 0.88 | 0.68 0.88 |
| GW [eV] | 0.82 1.76 | 0.82 1.76 |
| rel. area [%] | 88 | 12 |

3. Preparation of the substrates: LEED

In Figure S2(a) and S2(b) the typical 1 × 1 LEED pattern of rutile TiO₂(100) and rutile TiO₂(110) prepared with/without oxygen during the last annealing step are shown. Compared to Figure S2(a), the LEED pattern of Figure S2(c) is broadened and the background is increased, indicating the presence of smaller defect-free rutile TiO₂(100) domains at the surface. Additional streaks along the (001) crystallographic axis in SI Figure S2(c) may indicate the presence of additional ordered structures on the substrate surface. An example of a LEED pattern for rutile TiO₂(110) with a higher number of defects (prepared without oxygen in the last annealing step) is shown in Figure S2(d).

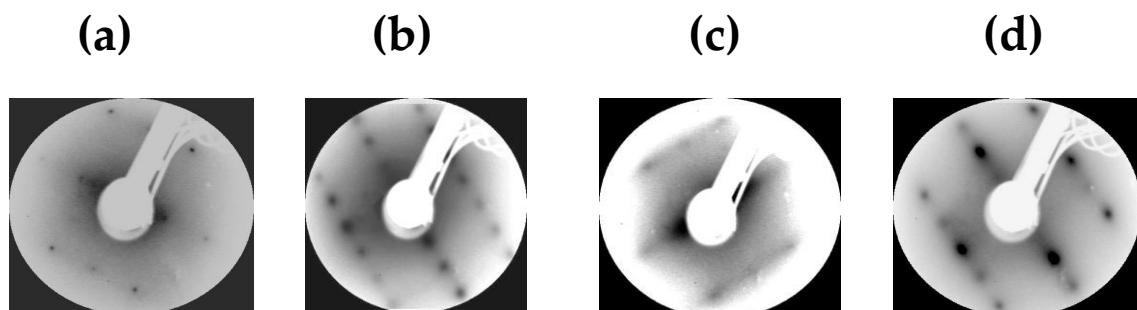

Figure S2: Typical LEED 1x1 pattern of (a) rutile TiO₂(100) and (b) rutile TiO₂(110). a) and b) were prepared with oxygen in the last step, while c) and d) were prepared without oxygen exposure during the last annealing step. The energy E of the low energetic electrons was about 90 eV. Also for a defect rich rutile TiO₂(100) surface, the 1 × 1 pattern are detectable (c) (E = 80 eV), even if streaks and a stronger background appear, pointing to a smaller size of ordered domains. For a defect rich rutile TiO₂(110) surface, the 1x1 pattern are also detectable (d) (E = 89 eV).

4. N 1s and C 1s peakfit parameters for FePc on rutile TiO₂(100) prepared in presence of oxygen

Table S4: Peak fit parameters for spectra shown in Figure 5(a) of the manuscript. Top: N 1s (top). Bottom: C 1s.

6. N-K edge XAS spectrum of a 5.5 nm thick FePc film on rutile TiO₂(110)

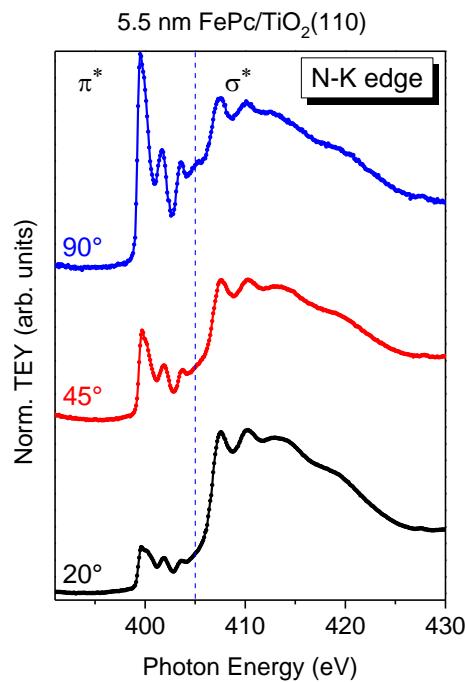

Figure S4: N-K edge X-ray absorption spectra for a thick FePc film on rutile TiO₂(110) (prepared in presence of oxygen during the last annealing step). The maximum of π^* resonances is observed at normal incidence (90°), indicating a preferred standing orientation of FePc molecules.

7. XPS spectra of FePc on rutile TiO₂(110) prepared in presence of oxygen

Table S6: Peak fit parameters for C 1s and N 1s spectra of a 7.3 nm and a 0.2 nm thick FePc film on rutile TiO₂(110) (manuscript, Figure 10). Top: N 1s, bottom: C 1s

| rel. area [%] | 65.0 | 10.1 | 20.9 | 4.0 | | 65.0 | 10.1 | 20.9 | 4.0 |

8. XPS spectra of FePc on rutile TiO₂(110) prepared in absence of oxygen

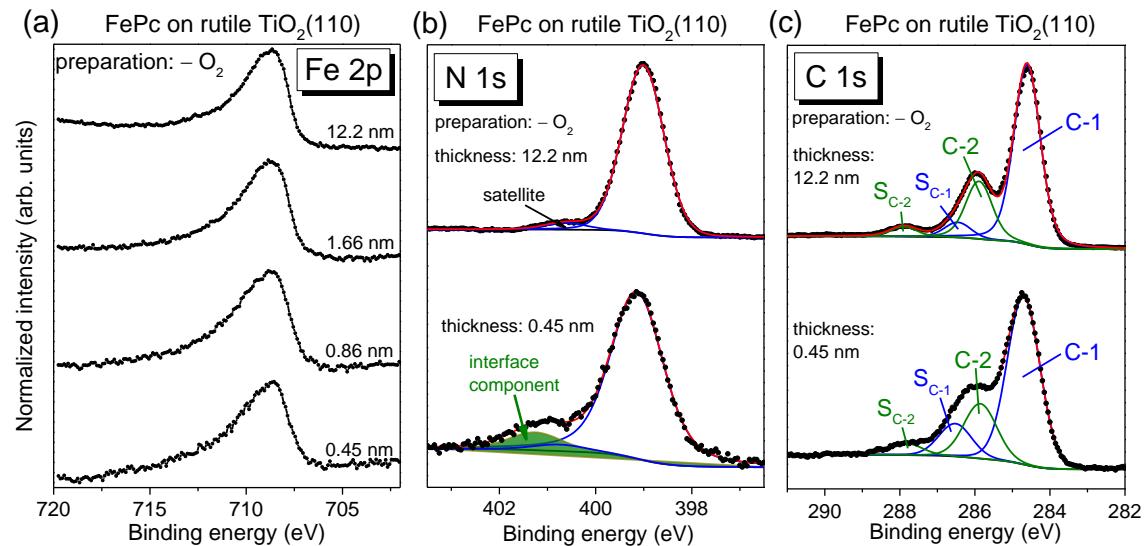

Figure S5: Thickness dependent core level spectra of FePc on rutile TiO₂(110) (excited with monochromatized Al K α radiation, $h\nu = 1486.6$ eV): (a) Fe 2p, (b) N 1s, (c) C 1s. Similar to FePc on rutile TiO₂(100), the spectra are essentially broadened for low coverages and a weak interface component is found in N 1s spectra. Note that the fitting parameters differ from measurements with conventional Al K α excitation, in particular with respect to the Gaussian width.

Table S7: Peak fit parameters of spectra shown in Figure S5.

| 12.2 nm | S1 | S2 | 0.45 nm | S1 | S2 | S3 |
|---------------------------|-----------|-----------|----------------|-----------|-----------|-----------|
| | N-1 | S(N-1) | | N-1 | NE-1 | S(N-1) |
| peak position [BE, eV] | 398.8 | 400.4 | | 399.2 | 401.2 | 400.8 |
| LW [eV] | 0.10 | 0.10 | | 0.10 | 0.10 | 0.10 |
| GW [eV] | 0.96 | 0.96 | | 1.26 | 1.26 | 1.26 |
| rel. area [%] | 96 | 4 | | 86 | 11 | 3 |

|---------------------------|-----------|-----------|-----------|-----------|----------------|-----------|-----------|-----------|-----------|
| | C-1 | S(C-1) | C-2 | S(C-2) | | C-1 | S(C-1) | C-2 | S(C-2) |
| peak position [BE, eV] | 284.6 | 286.5 | 285.9 | 287.9 | | 284.7 | 286.5 | 285.9 | 287.8 |
| LW [eV] | 0.10 | 0.10 | 0.10 | 0.10 | | 0.10 | 0.10 | 0.10 | 0.10 |
| GW [eV] | 0.81 | 0.81 | 0.81 | 0.81 | | 0.97 | 0.97 | 0.97 | 0.97 |
| rel. area [%] | 68.2 | 6.0 | 22.3 | 3.5 | | 62.8 | 12.3 | 20.6 | 4.3 |

9. Ultraviolet–visible (UV-vis) absorption spectra of FePc and FePcF₁₆

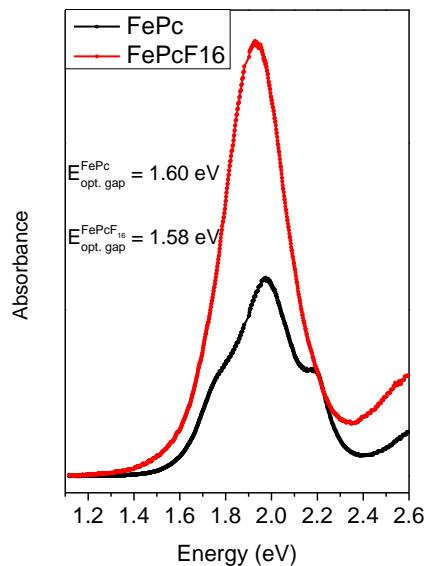

Figure S6: UV-vis spectra of FePc (black) and FePcF₁₆ (red) evaporated on glass. The optical band gap was determined by extrapolation of the onset of the spectra. We obtain 1.60 eV and 1.58 eV for FePc and FePcF₁₆, respectively.

10. Thickness dependent Fe 2p XPS spectra of FePcF₁₆ on rutile TiO₂(100)

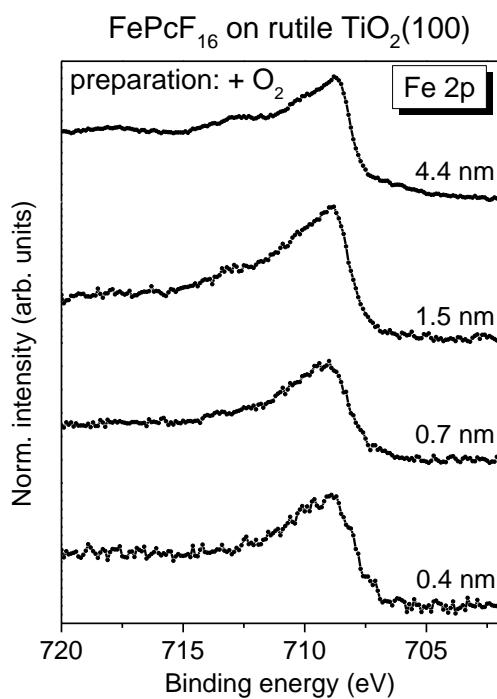

Figure S7: Thickness dependent Fe 2p core level spectra of FePcF₁₆ on rutile TiO₂(100) (excited with monochromatized Al K α radiation, $h\nu = 1486.6$ eV), prepared in presence of oxygen during the last annealing step. No interface component could be detected. The different peak shape, compared to FePc, might be due to a different spin configuration of Fe in thin films.

11. N 1s and C 1s peak fit parameters of FePcF₁₆ on rutile TiO₂(100)

Table S8: Peak fit parameters of a 4.4 nm and a 0.4 nm thick FePcF₁₆ film on rutile TiO₂(100) (manuscript, Figure 11), which is prepared in an oxygen partial pressure and measured with a monochromatized X-ray source (1486.6 eV). (a) N 1s, (b) C 1s 4.4 nm thick film, (c) C 1s 0.4 nm thick film.

14. Fe 2p XPS spectra of FePcF₁₆ on defect-rich rutile TiO₂(100) prepared without O₂

Figure S8: Thickness dependent Fe 2p core level spectra of FePcF₁₆ on rutile TiO₂(100) (excited with monochromatized Al K α radiation, $h\nu = 1486.6$ eV), prepared in absence of oxygen. Extra intensity in monolayer spectrum at 707.5 eV (black line in S8) may point to an interface component. The broadening for high film thickness might be caused by a change of the Fe spin state in FePcF₁₆.
