Content:

Supplementary Figure S1: DMSO effect on the viability of U87MG human glioblastoma cells.

Supplementary Figure S2: Densitometry of PARP1 level.

Supplementary Figure S3: The measure of the level of the phosphorylated (active) form of FAK (p-FAK).

Supplementary Figure S4: Quantification of the level of the phosphorylated (active) form of Akt (p-Akt).

Supplementary Figure S5: UPLC chromatogram of *Crataegus monogyna* berries (CB1).

Supplementary Figure S6: UPLC chromatogram of *Crataegus monogyna* leaves (CL1).

Supplementary Figure S7: UPLC chromatogram of *Crataegus monogyna* flowers (CF1).

Supplementary Table S1: EC₅₀ (µg/mL) values for the examined *Crataegus* extracts on the viability of U87MG human glioblastoma cells.

Supplementary Table S2: Content of polyphenolic compounds in berries, leaves and flowers of the different *Crataegus* species.

Supplementary Table S3: Extraction yield of particular samples (in %)

Supplementary Table S4: Calibration curve parameters of the method developed for each standard

Figure S1. DMSO effect on the viability of U87MG human glioblastoma cells. Cells were treated up to 72 hours with different concentrations of DMSO (0.02–1.5%) depending on the flower extracts concentration (see lower raw). The viability

was assayed by the MTS test. The number of viable control (non-treated) cells of each time point served as 100%. Graphs represent mean values \pm SD from three independent experiments.

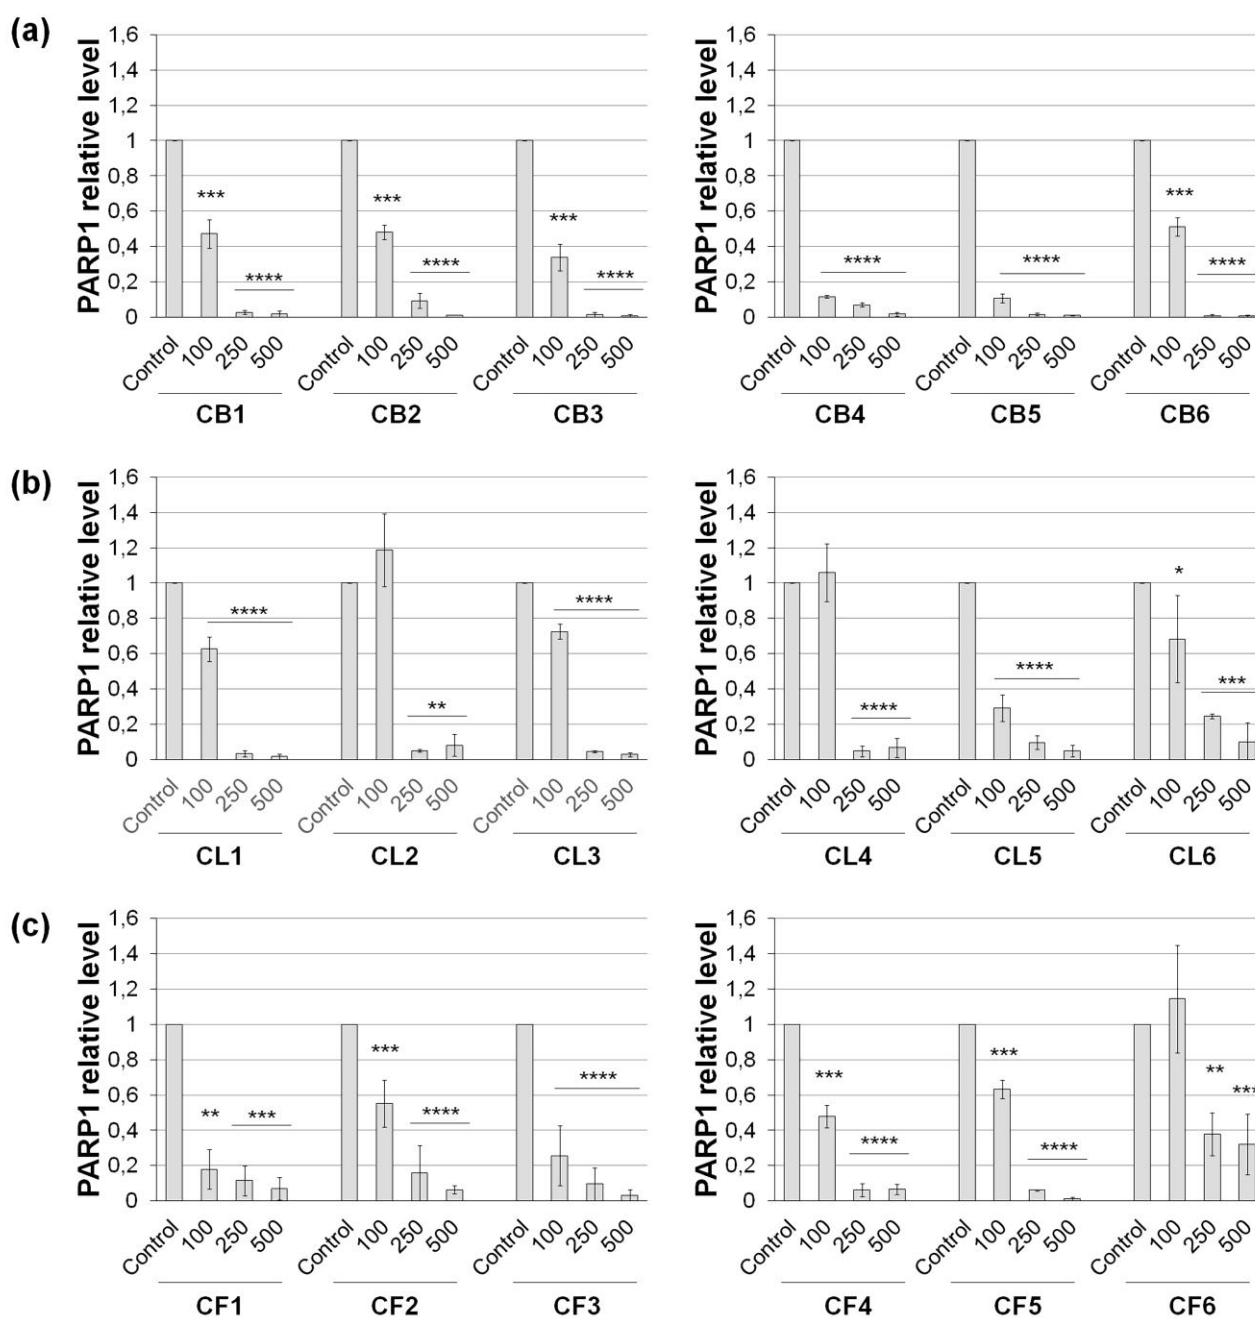

Figure S2. Densitometric analysis of the PARP1 level. Cells were incubated with *Crataegus* berry (a), leaf (b) and flower (c) extracts in 100, 250, and 500 μ g/mL concentrations for 48 h. Non-treated cells served as a control. Graphs represent mean value \pm SD. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, **** $p < 0.0001$ relative to control.

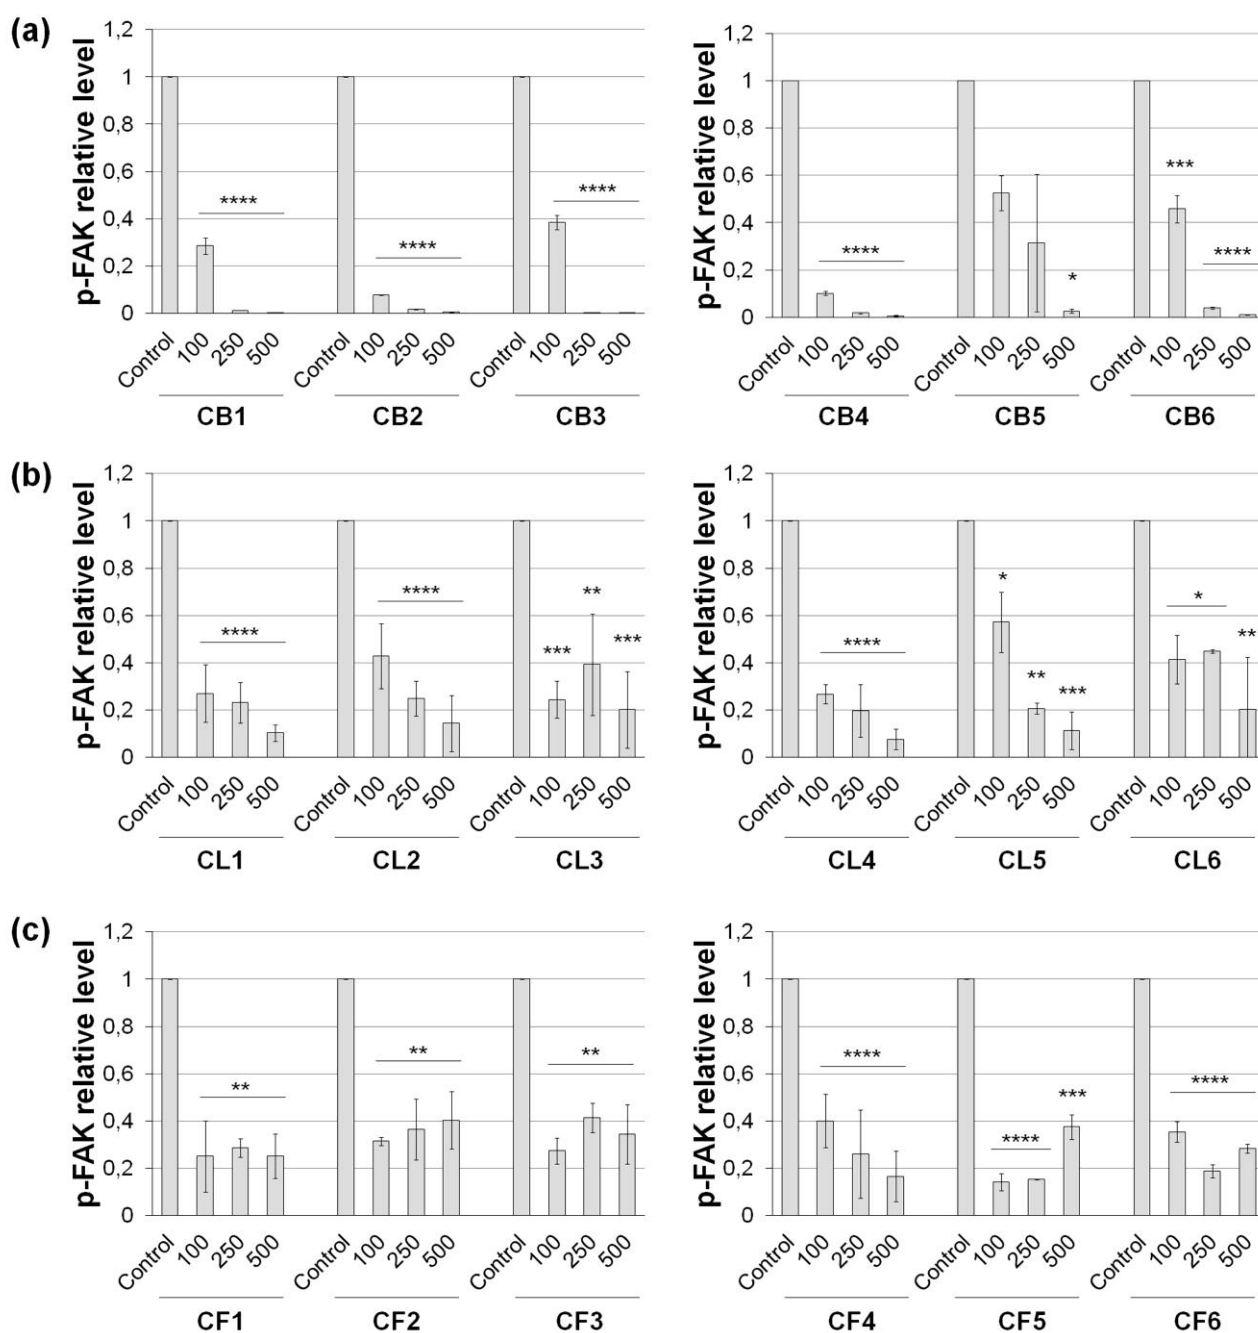

Figure S3. Densitometric analysis of the level of phosphorylated (active) form of FAK (p-FAK). Cells were incubated with *Crataegus* berry (a), leaf (b) and flower (c) extracts in 100, 250, and 500 µg/mL concentrations for 48 h. Non-treated cells served as a control. Graphs represent mean value ± SD. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, **** $p < 0.0001$ relative to control.

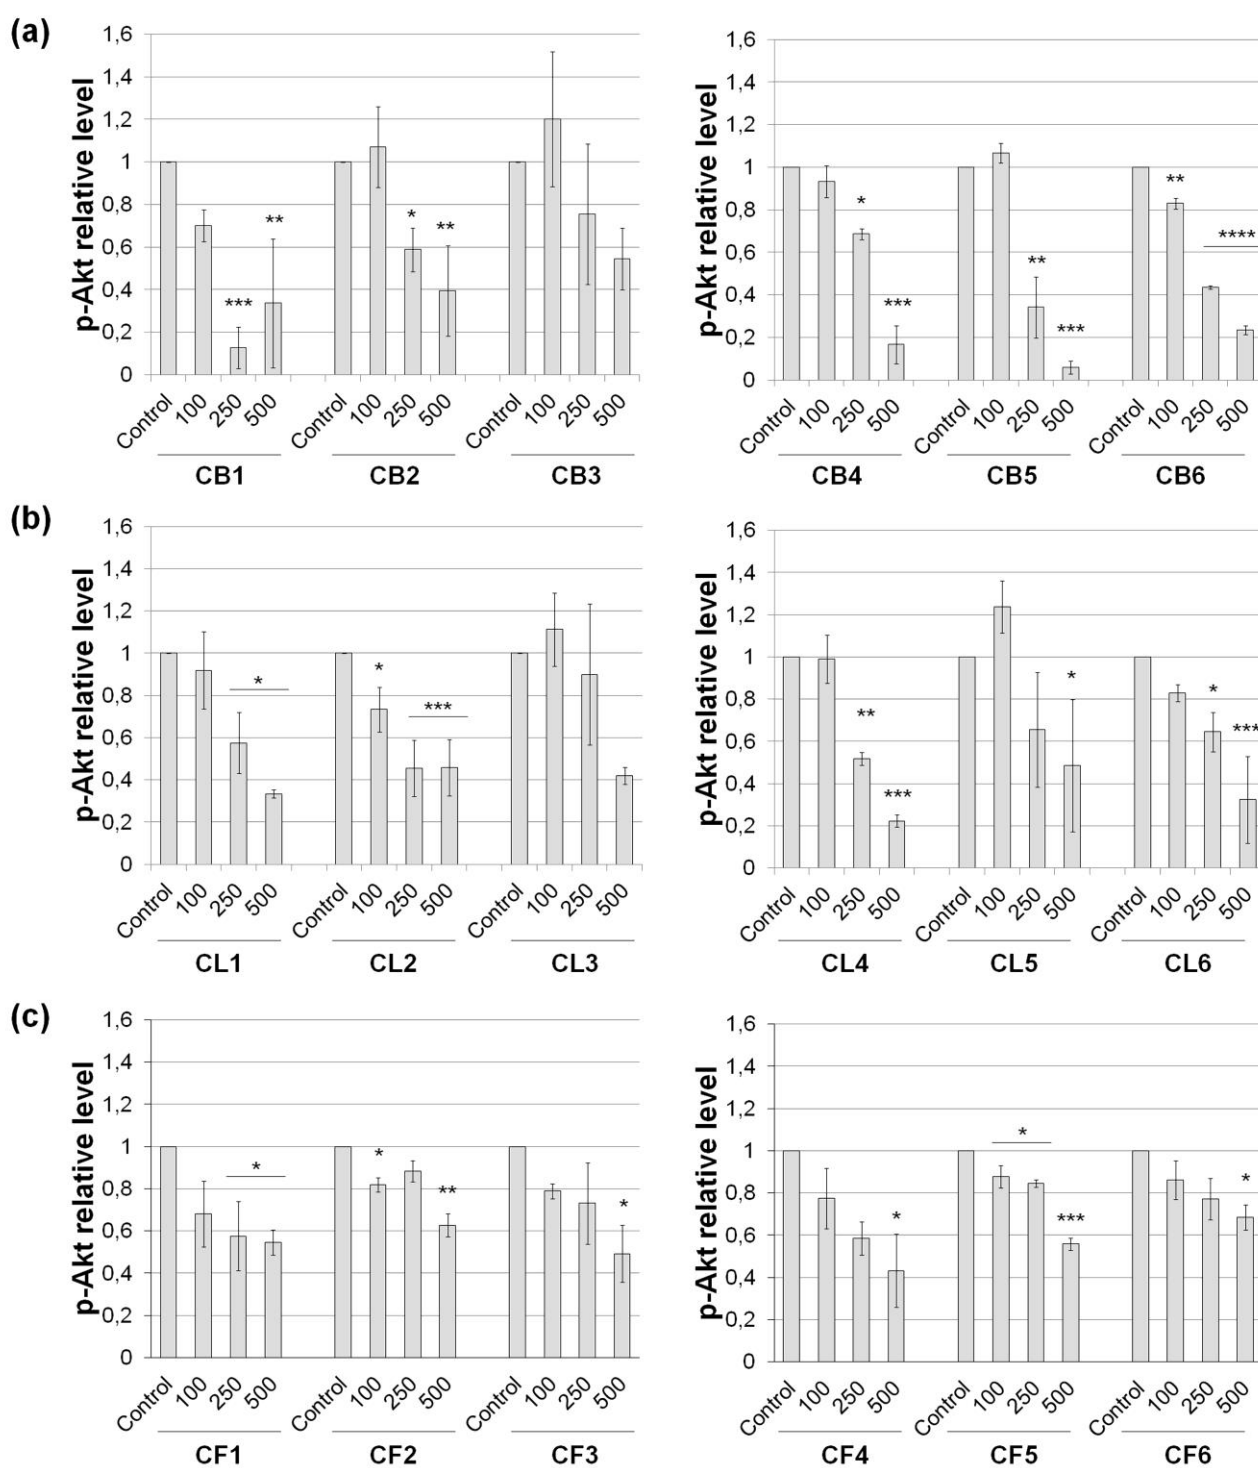

Figure S4. Densitometric analysis of the level of phosphorylated (active) form of Akt (p-Akt). Cells were incubated with *Crataegus* berry (a), leaf (b) and flower (c) extracts in 100, 250, and 500 µg/mL concentrations for 48 h. Non-treated cells served as a control. Graphs represent mean value \pm SD. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, **** $p < 0.0001$ relative to control.

Figure S5. UPLC chromatogram of *Crataegus monogyna* berries (CB1). A, PDA chromatogram extracted at 520 nm for anthocyanins visualization, B, PDA chromatogram extracted at 350 nm for other phenolics, C – total ion current.

Figure S6. UPLC chromatogram of *Crataegus monogyna* leaves (CL1). A, PDA chromatogram extracted at 350 nm, B, total ion current.

Figure S7. UPLC chromatogram of *Crataegus monogyna* flowers (CF1). A, PDA chromatogram extracted at 350 nm, B, total ion current.

Table S1. EC₅₀ (µg/mL) values for the examined *Crataegus* extracts on the viability of U87MG human glioblastoma cells.

Samples	EC ₅₀ , µg/mL

Total (mg/100 g d.b.)	7718.00 ± 131.76^f	3028.82 ± 33.39^a	3298.92 ± 80.38^b	4355.76 ± 103.22^c
------------------------------	-------------------------------------	------------------------------------	------------------------------------	-------------------------------------

Values are given in mg/100 g d.b. (dry basis) and are expressed as mean ± SD. Statistical significance was analyzed with Duncan's test. Values marked with different letters (between species) in the same row indicate statistically significant differences ($p < 0.05$), for more details see Materials and Methods; nd, not detected.

Table S3. Extraction yield of particular samples (in %).

Samples	Extraction yield (%)		
	Berries	Leaves	Flowers
C1	6.27	10.05	9.34
C2	5.73	8.34	8.98
C3	5.25	7.69	7.43
C4	5.69	8.61	8.40
C5	7.40	9.38	5.83
C6	6.32	9.47	5.93
