\* Compounds **4** and **14** were fully converted into ketoprofen (KPF), and compound **1** partly to its investigational perforin inhibitor **1a** and therefore, their transitions with a positive ion mode are reported only as KPF or as a prodrug and parent drug in parentheses. Compounds **7**, **12**, **13**, and **15** were also partly converted to their parent drugs (ferulic acid (FA), flurbiprofen (FLB), ibuprofen (IBU), and naproxen (NPX), respectively), whose transitions with a negative ion mode are reported below the studied LAT1-utilizing compounds in parentheses.

## 2. LC-MS/MS proteomic transitions for LAT1 peptides

**Table S2.** SRM/MRM transitions for absolute quantitative proteomics.

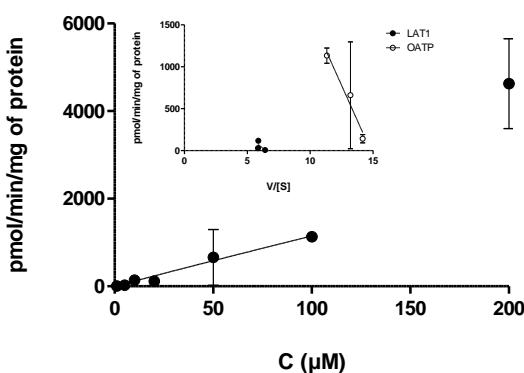

| Protein | St/IS | Unique amino acid sequence | Retention time (min) | Transition number | MRM transitions (m/z) |                   |
|---------|-------|----------------------------|----------------------|-------------------|-----------------------|-------------------|
|         |       |                            |                      |                   | Precursor ion (Q1)    | Product inos (Q3) |
| LAT1    | St    | VQDAFAAAK                  | 13.7                 | 1                 | 460.7                 | 821.4             |
