## **1. Characterization of Mn[O-terphenyl-O]<sup>Ph</sup>(THF)<sub>2</sub> (**2**) and its stoichiometric reactivity**

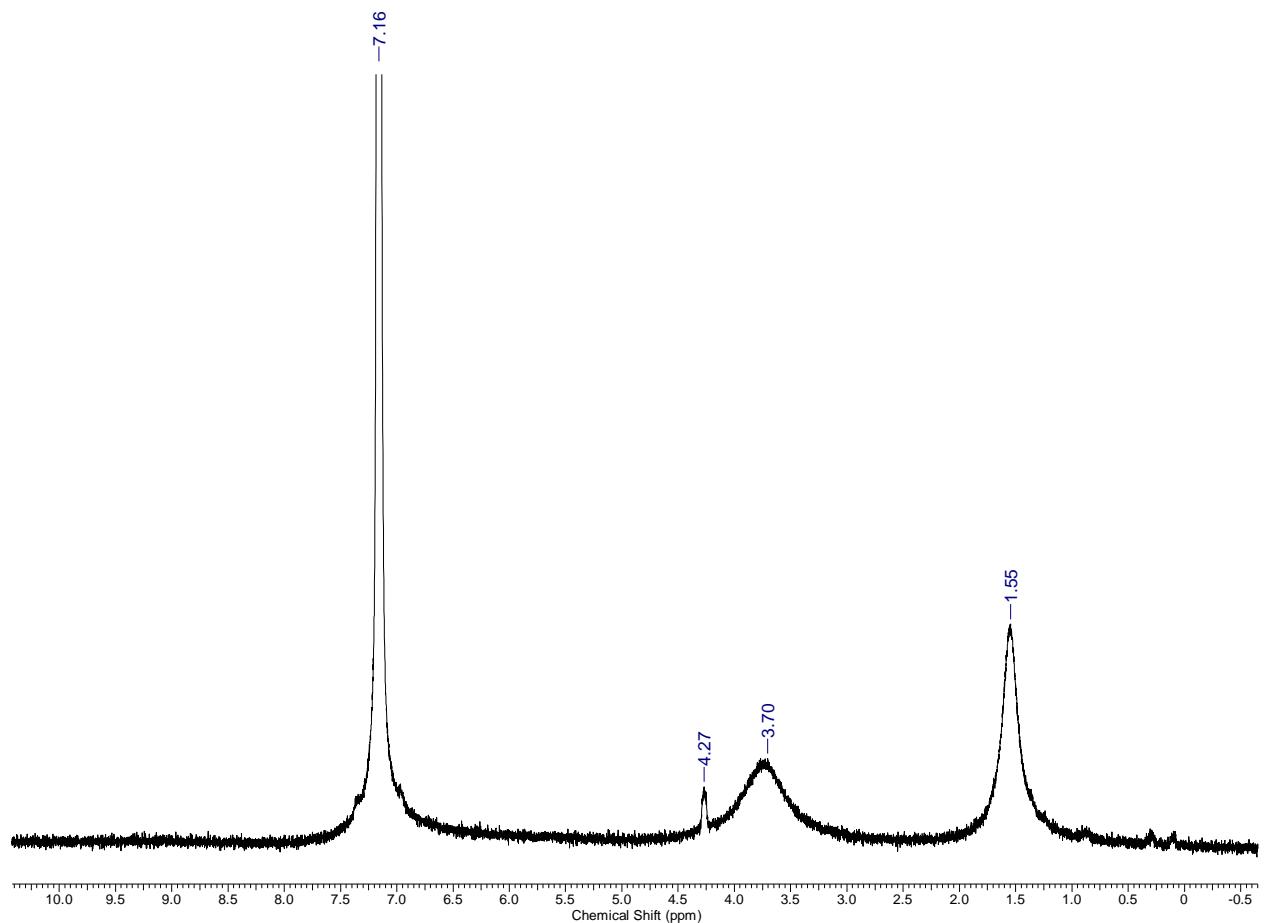

**Evans method formula and procedure.** Evans method was carried out using a standard NMR tube and a Wilmad coaxial insert (purchased from Aldrich). Carefully weighted (83 and 112 mg) sample of the Mn complex was dissolved in 1 ml of C<sub>6</sub>D<sub>6</sub> to prepare known concentrations of solutions which was further used for calculations. The insert with the solution was then placed inside an NMR tube containing C<sub>6</sub>D<sub>6</sub>. The resulting NMR spectra were used to measure molar susceptibility  $\chi_m$ . It was calculated using the equation (**1**).

$$\chi_m = \left[ \frac{3\Delta\nu}{4\pi m \nu_0} + \chi_0 \right] M \quad (\text{Eq. 1})$$

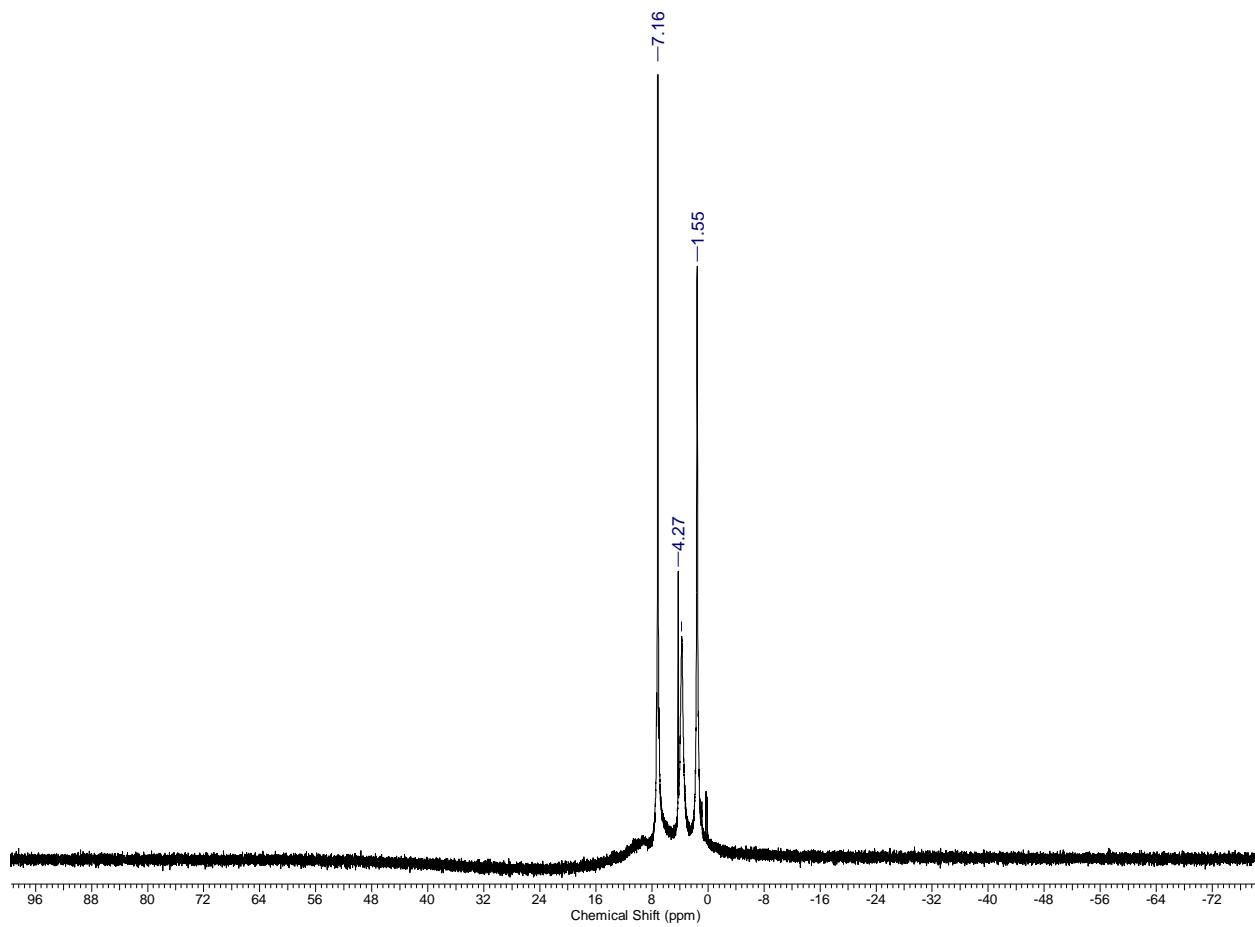

Where  $\Delta\nu$  is the peak separation (Hz),  $m$  is the concentration of the solution (g/mL),  $\nu_0$  is the spectrometer operating frequency in Hz,  $\chi_0$  is the molar susceptibility of the solvent (in cm<sup>3</sup>/g), and  $M$  is the molar mass of the compound (g/mol). Diamagnetic corrections were calculated using Pascals constants. The solution state effective magnetic moment ( $\mu_{eff}$ ) was calculated using Equation 2:

$$\mu_{eff} = \sqrt{(2.383 \times 10^3)(\chi_m)} \quad (\text{Eq. 2})$$

#### 4. Computational Data

All intermediates along the reaction pathway were probed as doublets, quartets, and sextets to allow for various combinations of  $\text{Mn}^{\text{II}}/\text{NR}^0$  to  $\text{Mn}^{\text{IV}}/\text{NR}^{2-}$ . Doublets were always higher in energy and are therefore only reported for the iminoiodinane/imido complexes. Multiple conformers of the tosyl substituent were probed (**Figure S28**) but the isomer with p-methyltoluene protruding into solution, and oxygen close to coordinating to Mn, was found to be lowest in energy for most structures (iso1). Different regio and stereoisomers were considered for the styrene added intermediate **C**. Unsurprisingly, the radical intermediate is significantly stabilized when localized on the secondary vs. primary carbon so we only present the former. We observe a stereochemical preference but that is due to our modeling only considering one possible conformation of the ligand backbone; in solution one expects a 50:50 mixture of these coordinations and therefore no stereoselectivity for one aziridine over another. Energies are summarized in Table S2, frequencies for optimized structures in Table S3, and all optimized structures can be found in the xyz file available in the Supporting Information.
