<b>8</b>		1.273(1), 1.283(2)	35.1(3)
<b>9</b>		1.276(5), 1.274(5)	0.0
<b>11</b>		1.280(2), 1.278(2)	-40.6(2)
<b>13</b>		1.284(5), 1.264(5)	61.1(7)

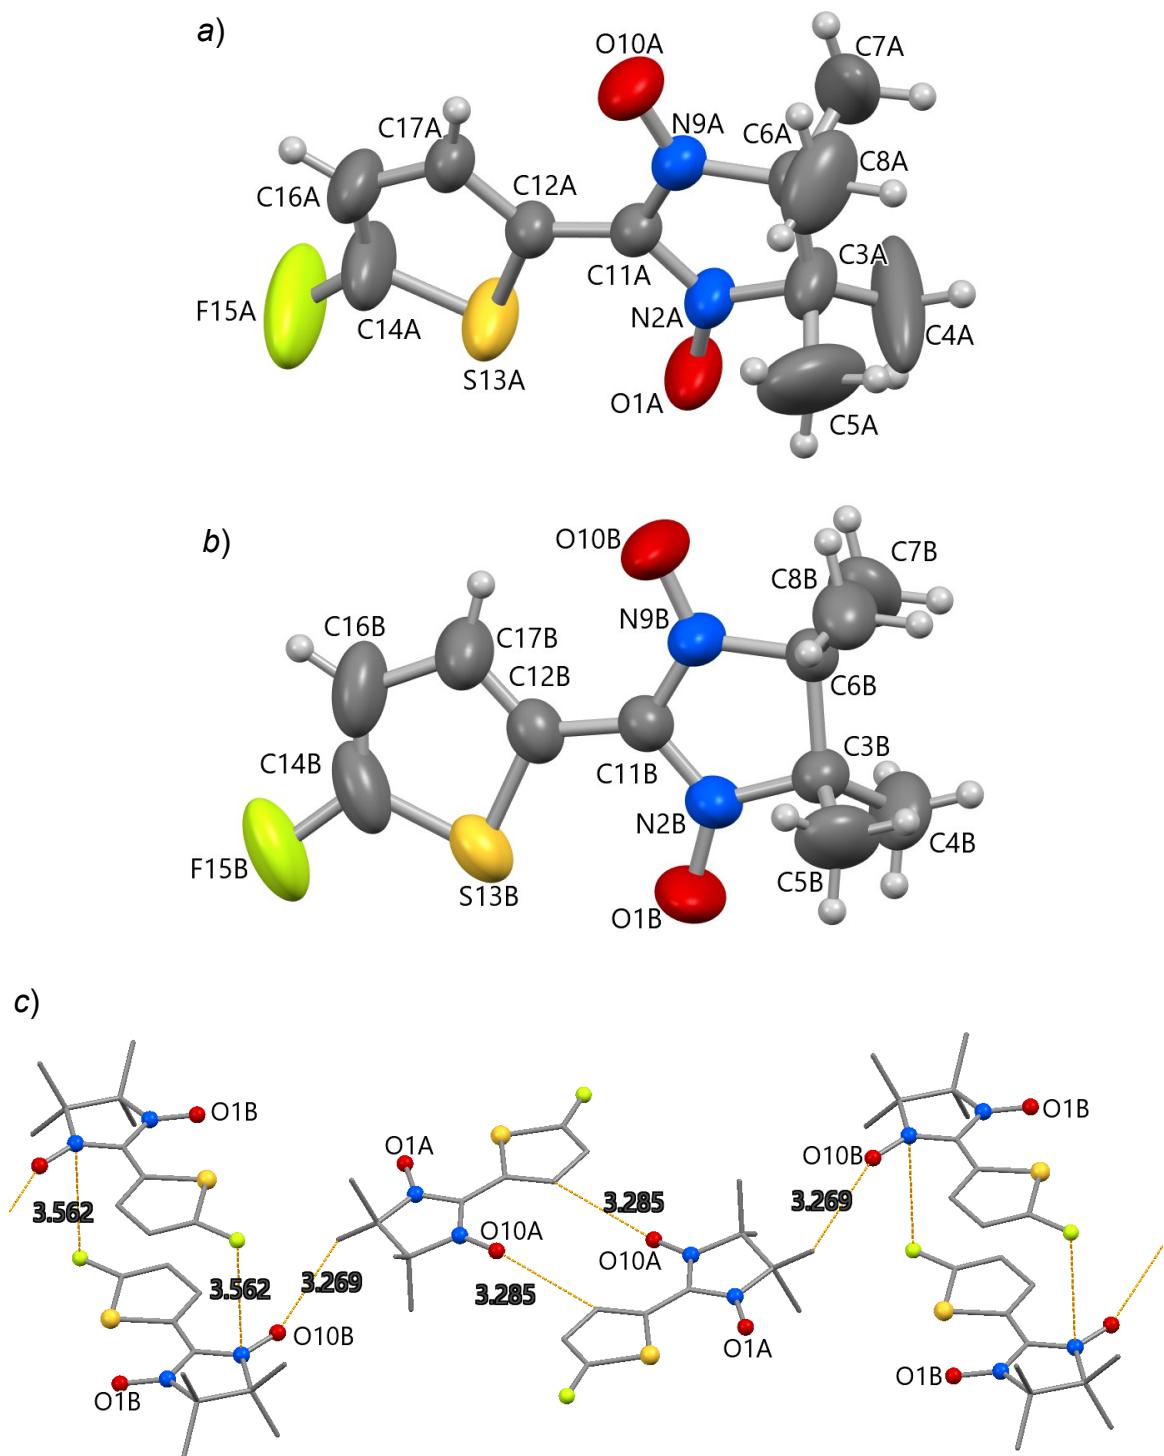

<sup>a</sup> Crystallographically independent molecules.

**Table S3.** Short contacts in the structures of nitronyl nitroxides (Å).

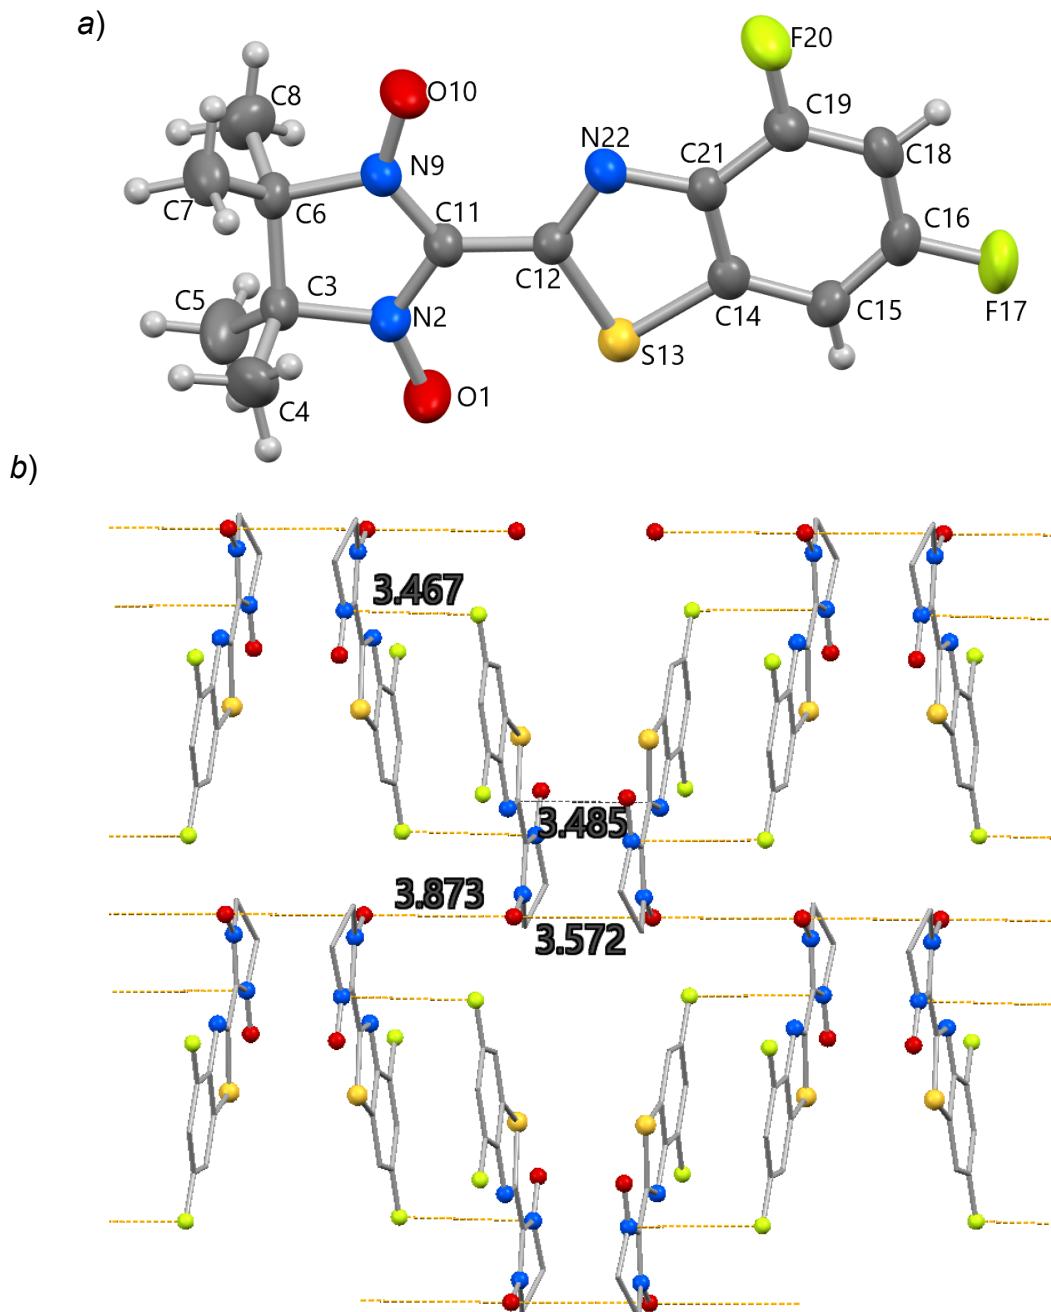

Radical	Intermolecular						Intramolecular
	O <sub>NO</sub> ...O <sub>NO</sub>	O <sub>NO</sub> ...N	F...N	O <sub>NO</sub> ...N	O <sub>NO</sub> ...O <sub>NO2</sub>	O <sub>NO</sub> ...H C	
<b>2</b>	4.119(4)	3.962(4), 3.986(3)	3.562(2)				3.346(6)
<b>3</b>	3.572(2), 3.873(2)	3.513(2)	3.467(2)				
<b>4</b>	3.905(6), 3.917(6)						
<b>7</b>	3.345(2)				3.315(2)		
<b>8</b>	3.371(2), 3.794(2)			3.365(2)			O <sub>NO</sub> ...F 3.042(1)
<b>9</b>	5.194(1)			4.788(1)			3.268(1), 3.154(1)
<b>11</b>	4.016(2), 4.188(2), 4.410(2)						
<b>13</b>	5.066(8)			3.374(6)	3.069(3)		Cl...Cl

In all radicals, the structure of the nitronyl nitroxide moiety is almost identical. The N–O bond lengths of the paramagnetic moiety are in the range 1.273(2)–1.284(5) Å. Nitronyl nitroxides differ in the values of torsion angles between the planes of the paramagnetic ONCNO moiety and the aromatic heterocycle, which is due to the steric influence of vicinal substituents (Figures S1–S8). Thus, in nitronyl nitroxides **2**, **3**, and **9** without substituents in the aromatic cycle, these angles do not exceed 2° (Table S2), while in the rest radicals their values are more than 32°.

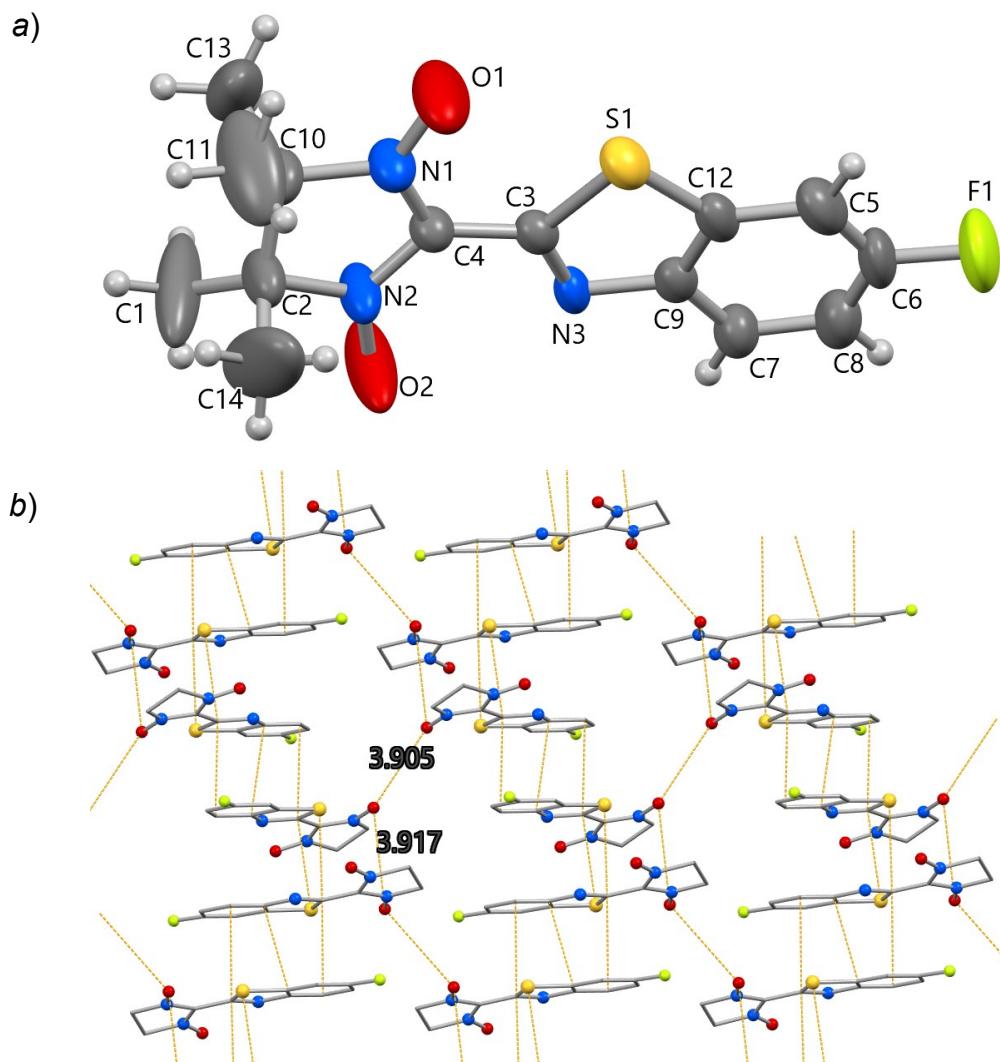

The structural features of heterocyclic substituents in nitronyl nitroxides **2**, **3**, **7**, **8**, **9**, **11** predetermine the diversity of intra- and intermolecular contacts in their structures (Table S3, Figures S1–S8). For example, in the crystal structures of paramagnets **2** and **3**, there are short F...N contacts (3.562 Å in **2** and 3.467(2) Å in **3**), and in the structures of radicals **2** and **9**, the molecules are linked in a chain via hydrogen bonds C–H...O<sub>NO</sub>.

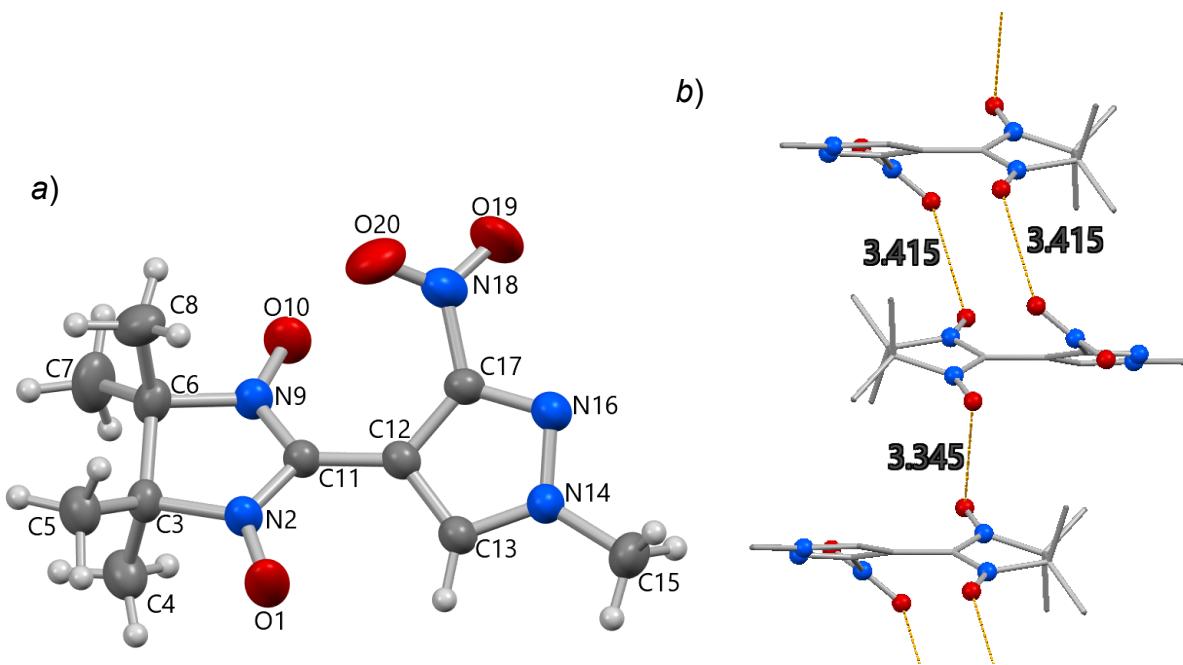

**Figure S1.** Structures of crystallographically independent molecules **2** (*a* and *b*) and short intermolecular contacts between molecules (*c*).

**Figure S2.** Structure of molecule **3** (*a*) and short intermolecular contacts in crystal structure (*b*).

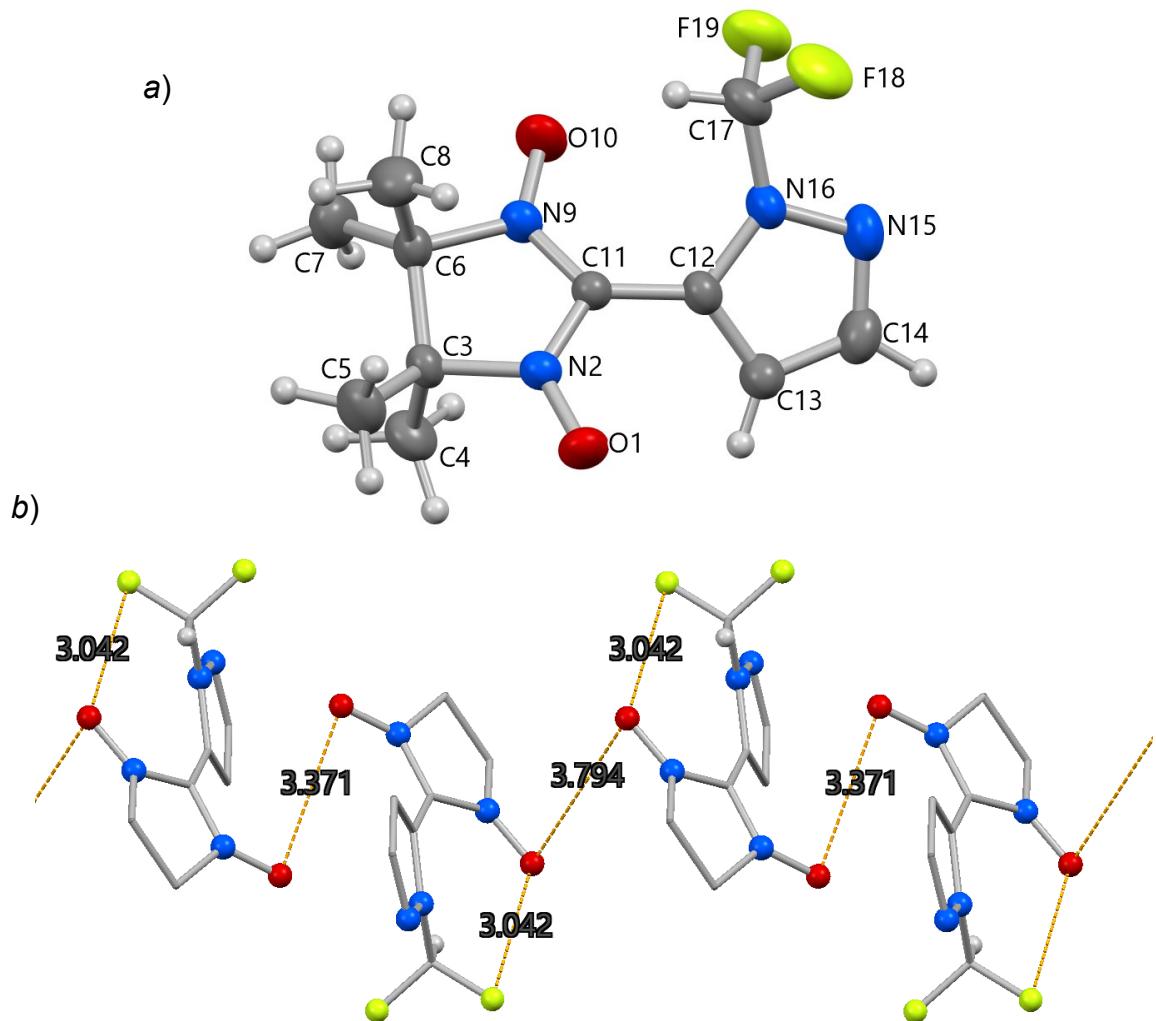

**Figure S3.** Structure of molecule **4** (*a*) and short intermolecular contacts in crystal structure (*b*).

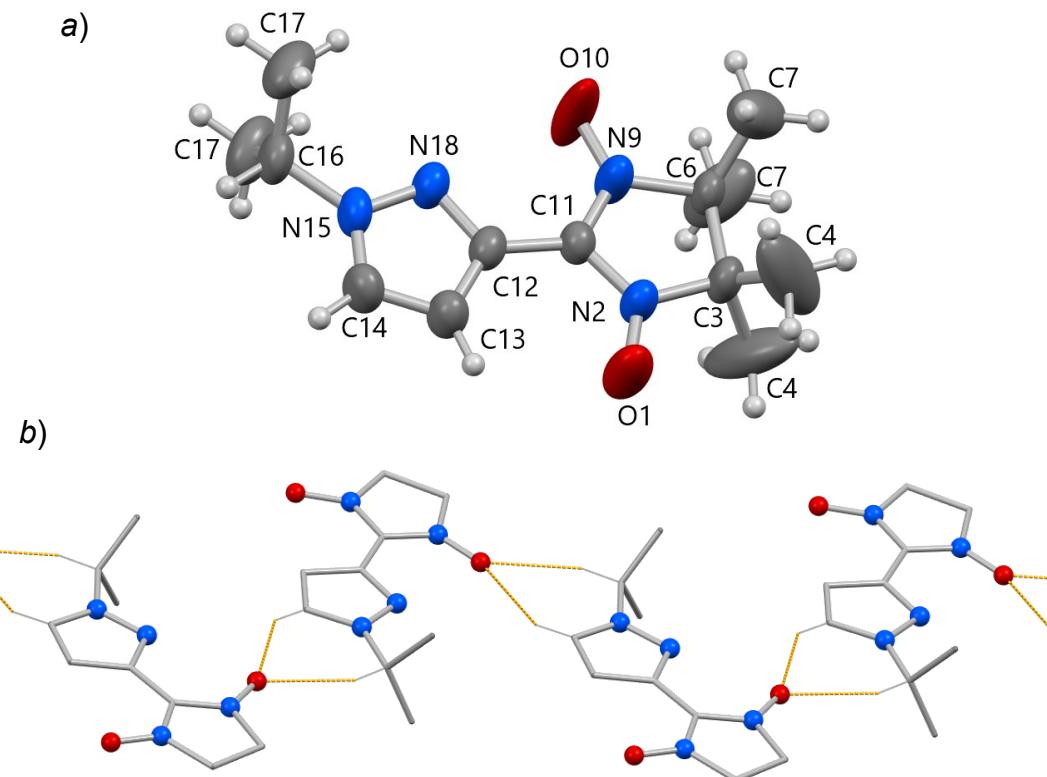

**Figure S4.** Structure of molecule **7** (*a*) and short intermolecular contacts in crystal structure (*b*).

A feature of crystal packing of nitronyl nitroxide **8** is the presence of a short intramolecular contact F...O<sub>NO</sub> (3.042 Å) and relatively short O<sub>NO</sub>...O<sub>NO</sub> distances (3.371 and 3.794 Å), alternating in the chain of molecules (Figure S5, b).

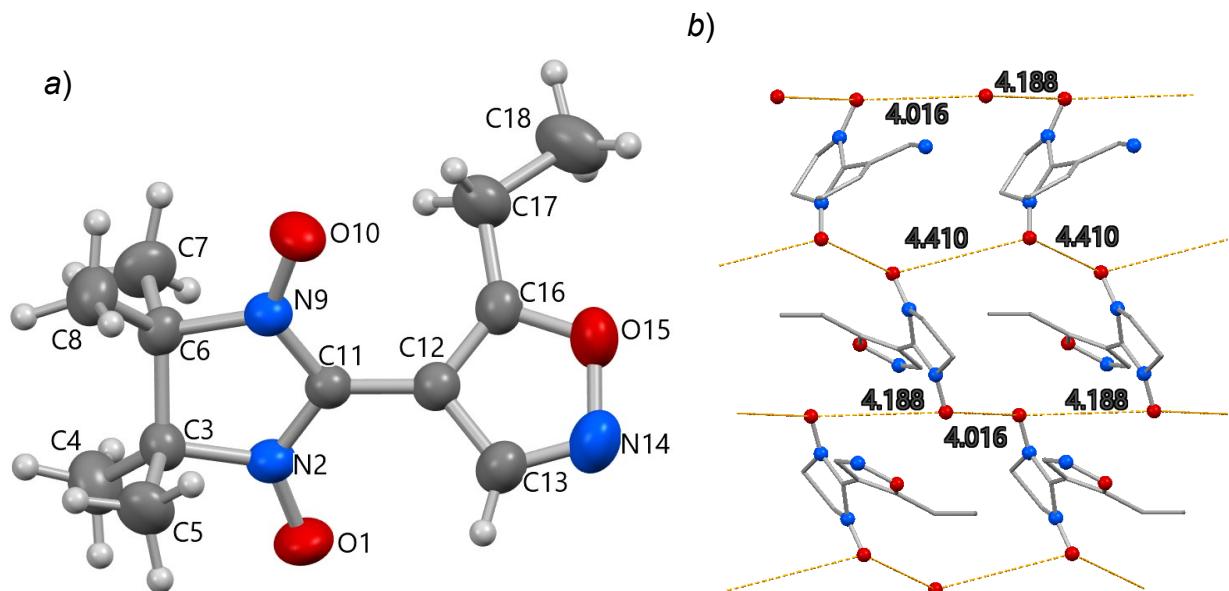

**Figure S5.** Structure of molecule **8** (a) and short intermolecular contacts in crystal structure (b).

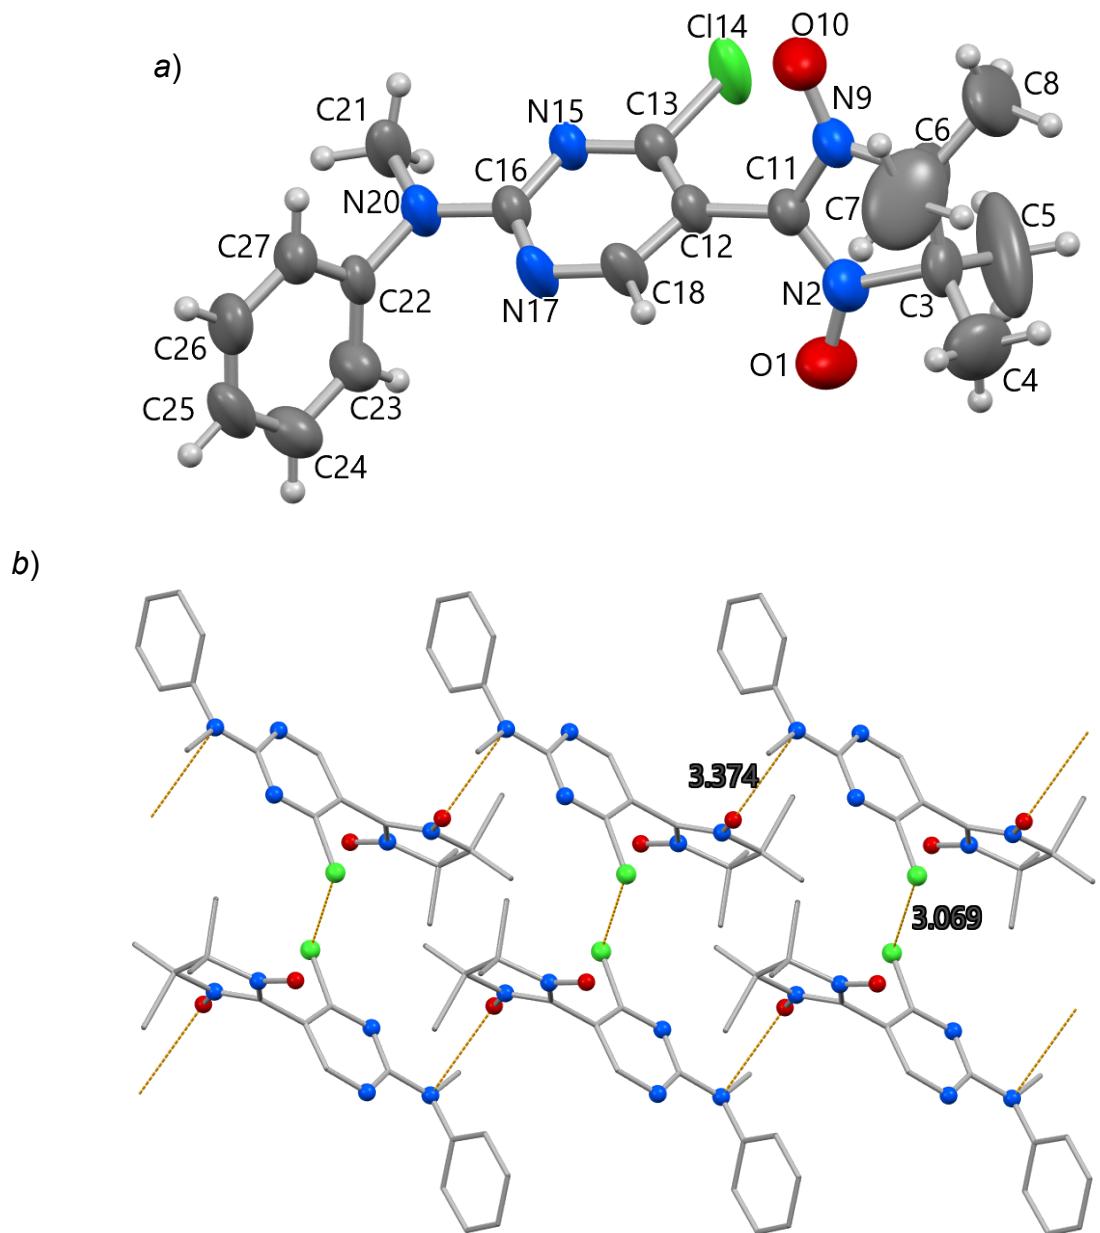

**Figure S6.** Structure of molecule **9** (*a*) and short intermolecular contacts in crystal structure (*b*).

In nitroxide **11**, the shortest contacts between paramagnetic centers exceed 4 Å (Figure S7), while in **7** the specific stacking of molecules makes it possible to distinguish dimers inside them with O...O<sub>NO</sub> distances of 3.345(2) Å (Figure S4).

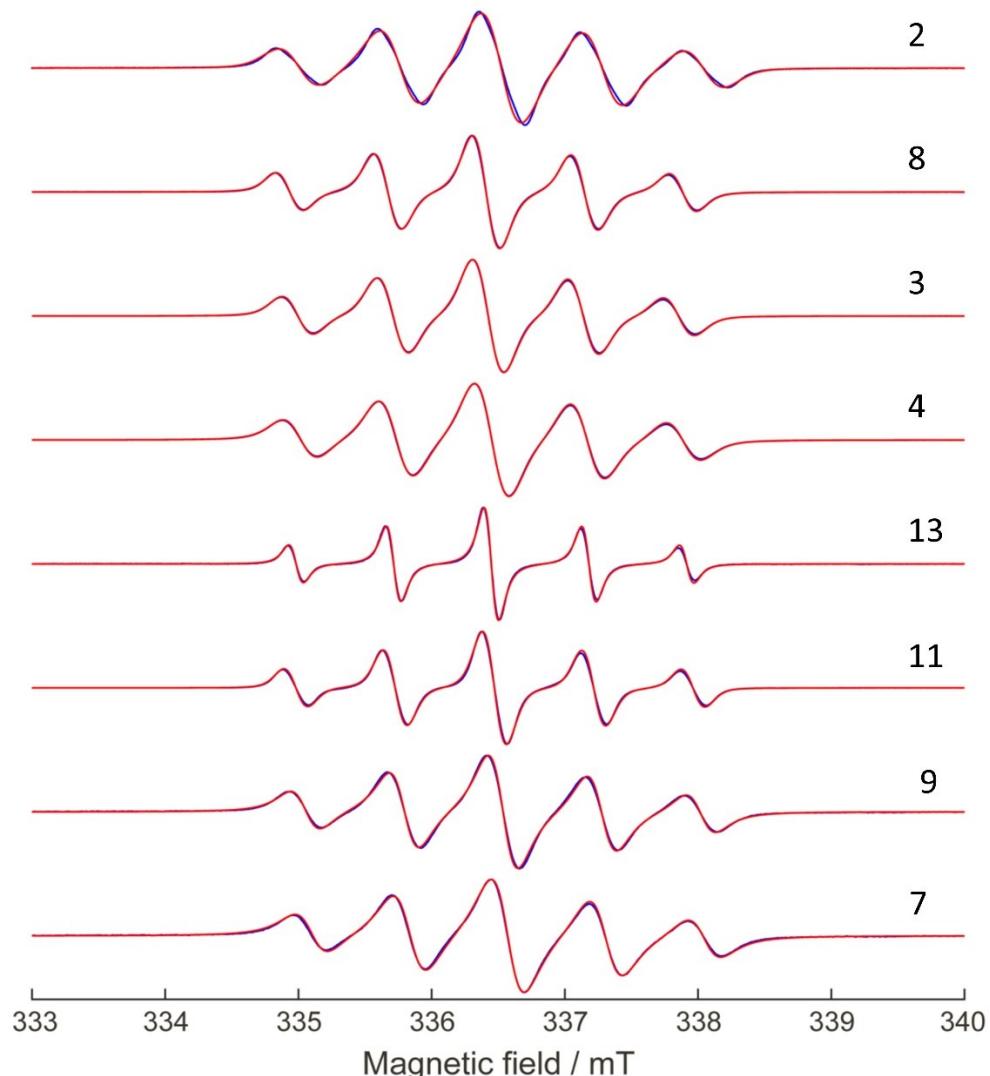

**Figure S7.** Structure of molecule **11** (*a*) and short intermolecular contacts in crystal structure (*b*).

**Figure S8.** Structure of molecule **13** (*a*) and short intermolecular contacts in crystal structure (*b*).

### Section S2. EPR Spectra

**Figure S9.** Continuous wave EPR spectra of nitronyl nitroxides (indicated in the plot) obtained in toluene solution at 290 K. Experimental traces are shown in blue, corresponding simulations – in red (see text for parameters).

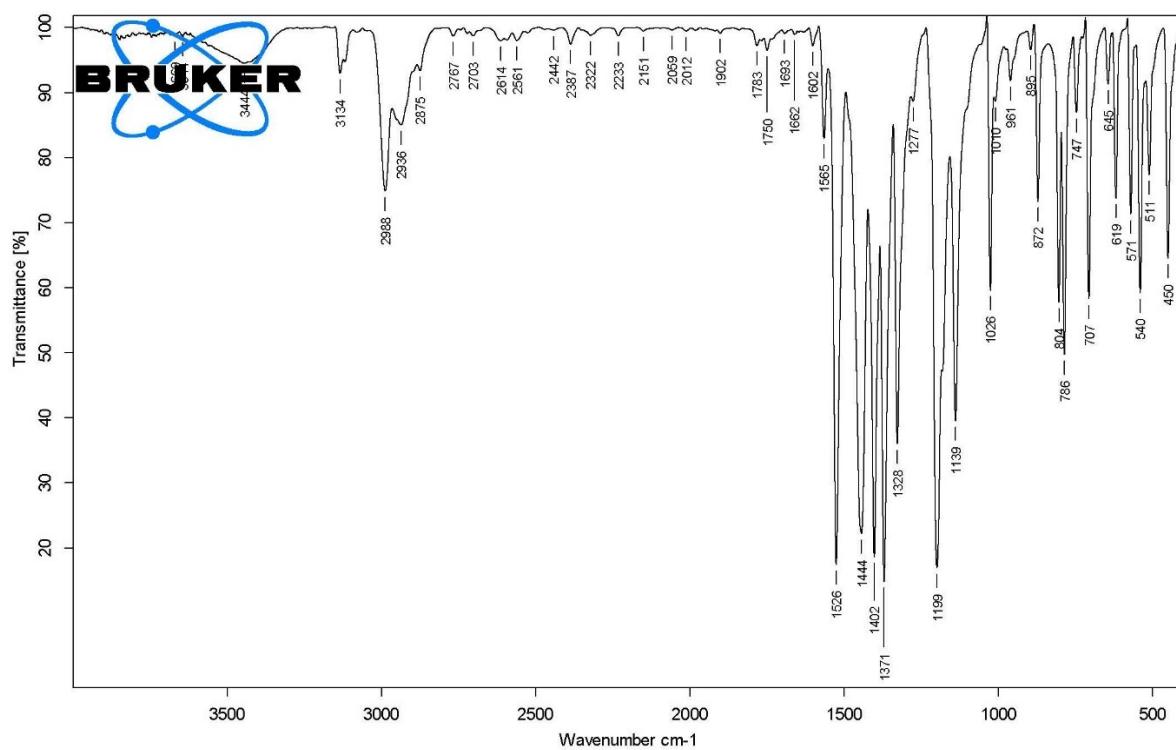

All obtained EPR spectra were simulated using a model of a radical ( $S=1/2$ ) with two equivalent  $^{14}\text{N}$  hyperfine interaction constants and isotropic g-factor. Different linewidths were accounted by corresponding Gaussian and Lorentzian broadenings. Table S4 shows the values of g-factors and HFI constants used in simulations shown in Figure S9.

**Table S4.** Parameters used in simulations shown in Figure S9:  $^{14}\text{N}$  isotropic hyperfine interaction constants ( $\mathbf{A}$ ) and corresponding g-factors.

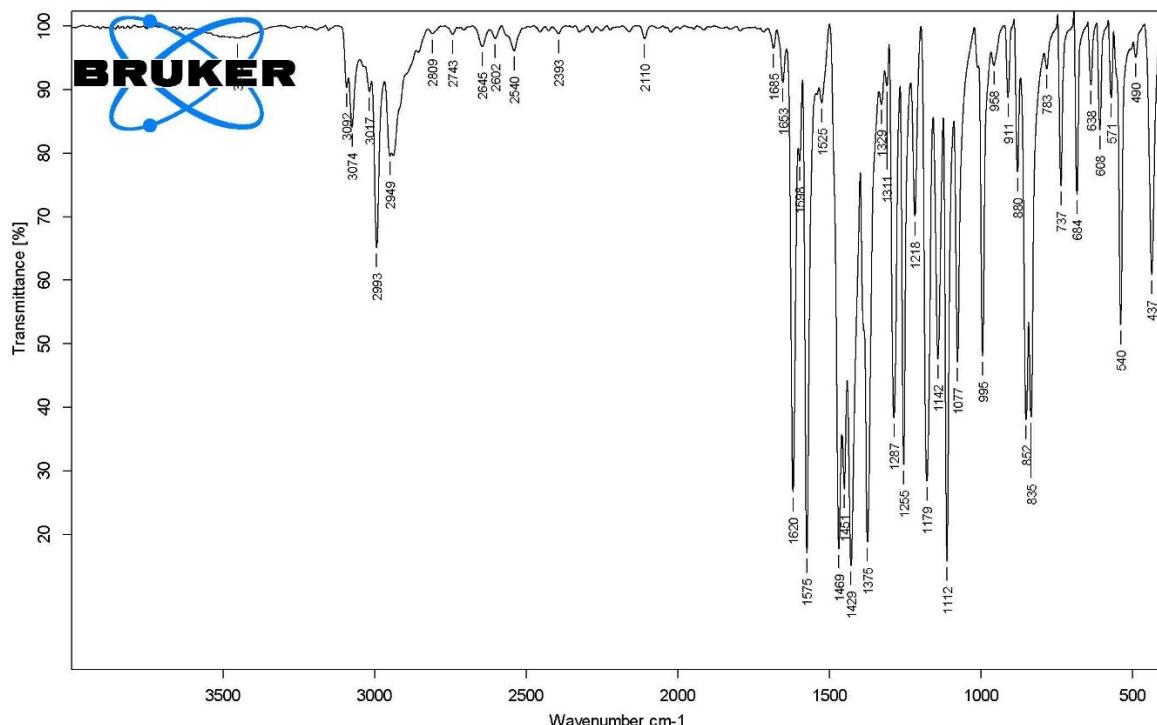

Nitronyl nitroxide	$\mathbf{A} / \text{mT}$	g-factor
<b>2</b>	0.761	2.007
<b>3</b>	0.717	2.007
<b>4</b>	0.720	2.007
<b>7</b>	0.738	2.007
<b>8</b>	0.740	2.007
<b>9</b>	0.744	2.007
<b>11</b>	0.747	2.007
<b>13</b>	0.735	2.007

As follows from Table S4, the obtained g-factors are nearly identical (within an accuracy of ~0.0002), and hyperfine interaction constants are also rather similar, being typical of nitronyl nitroxides.

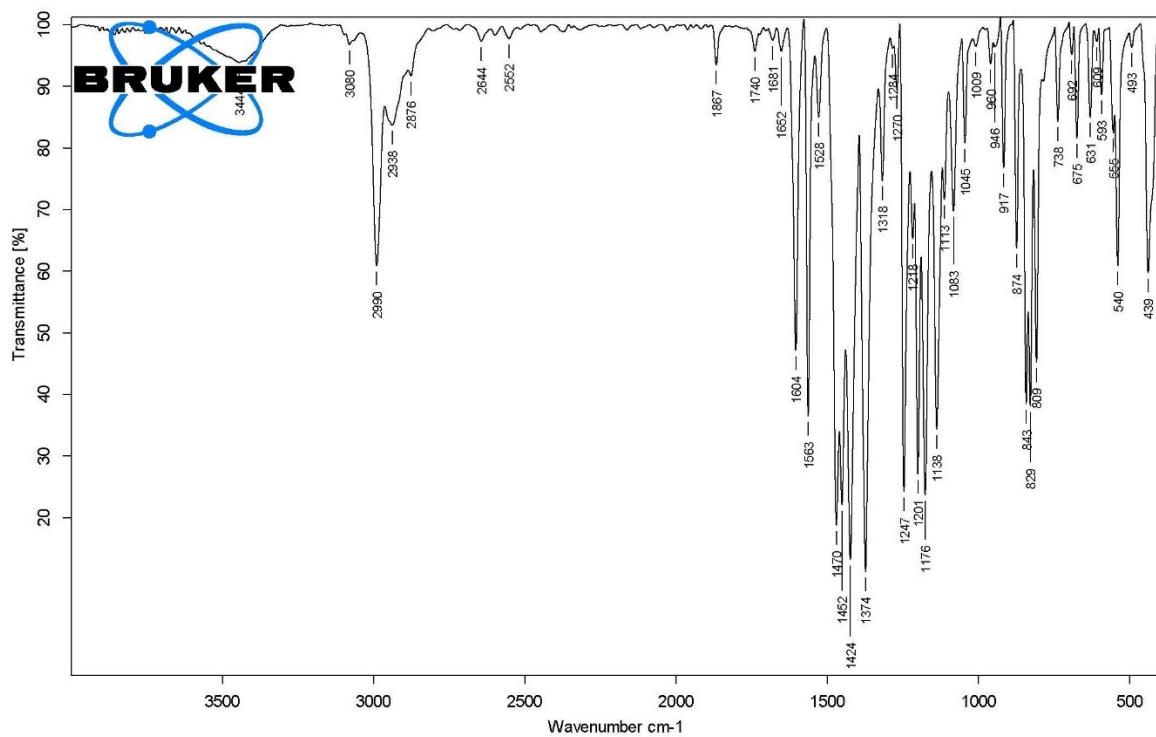

### Section S3. FT-IR Spectra

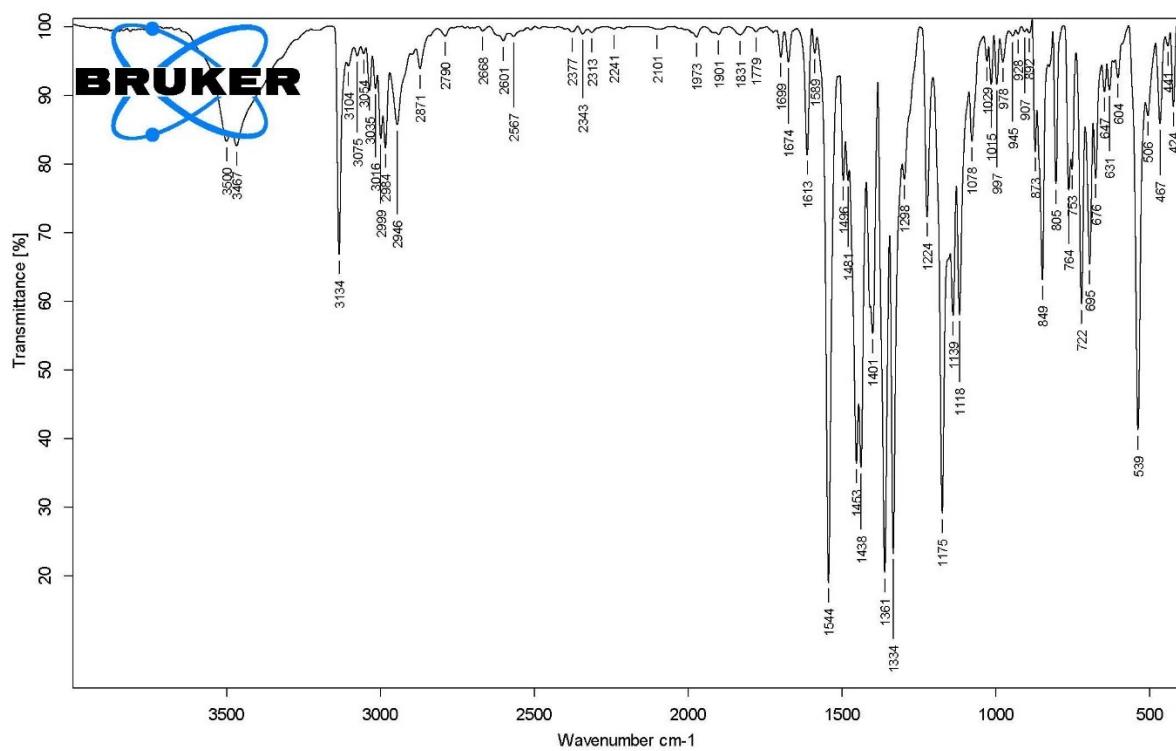

**Figure S10.** FT-IR spectrum of **2** in KBr.

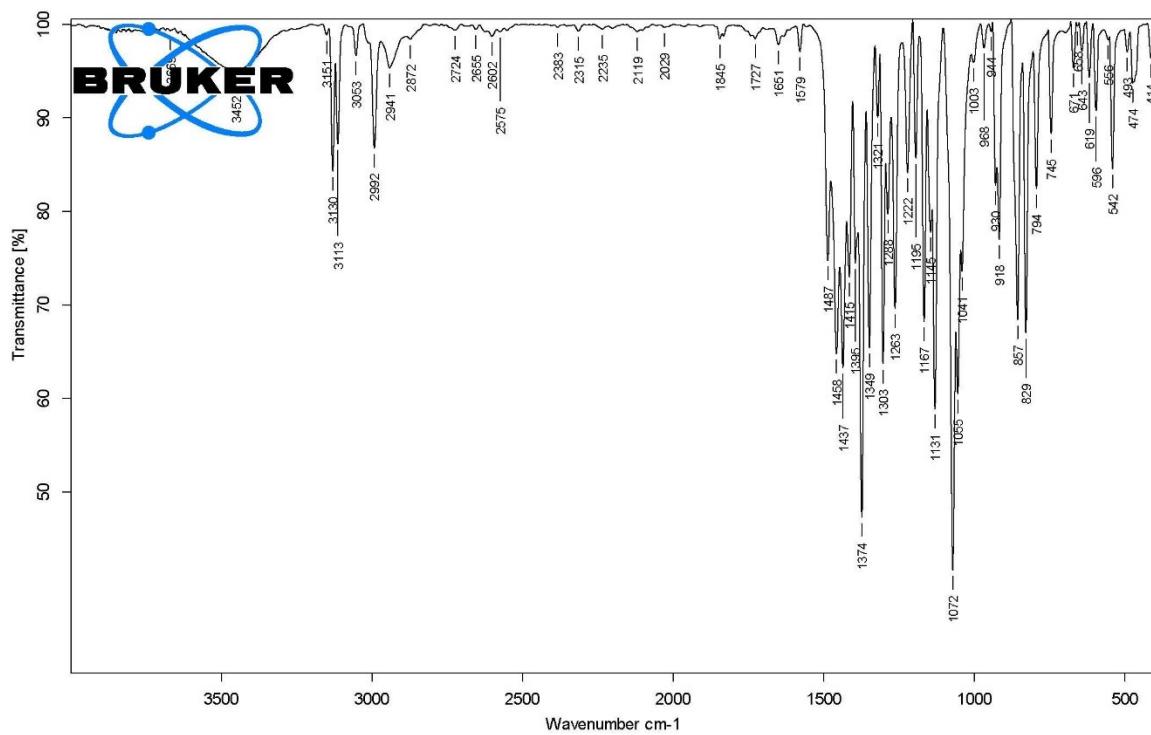

**Figure S11.** FT-IR spectrum of **3** in KBr.

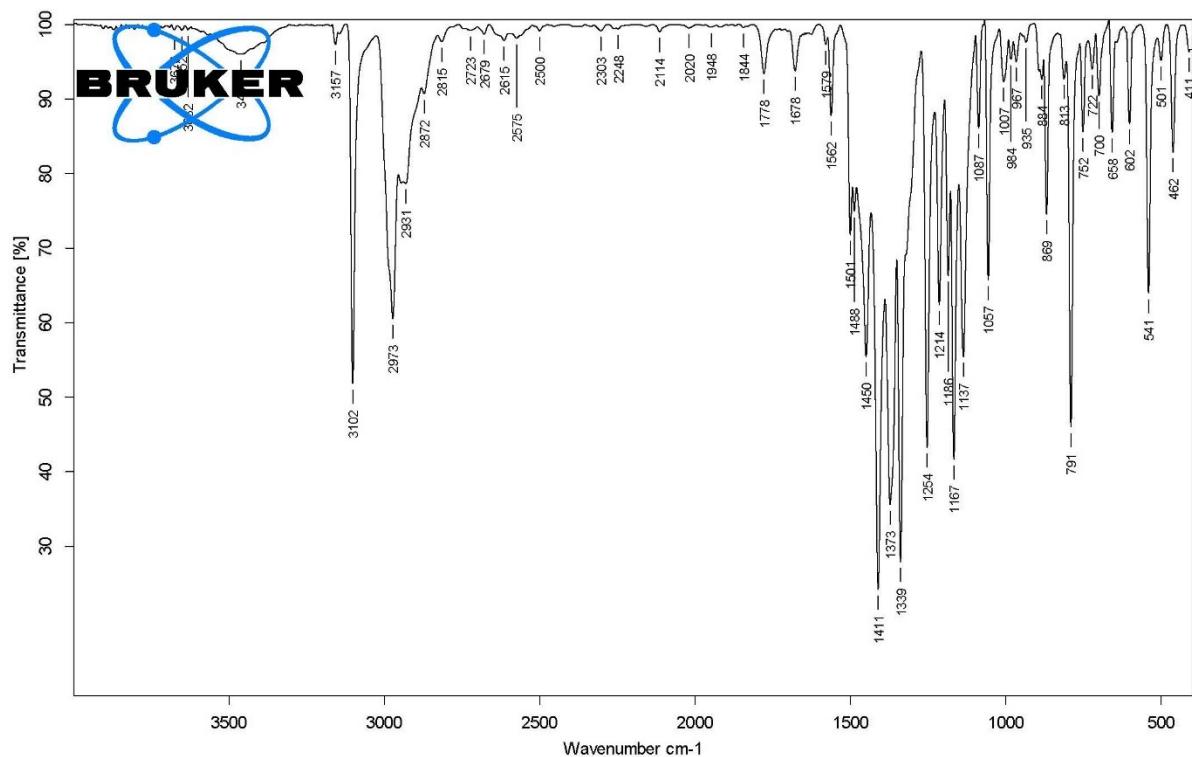

**Figure S12.** FT-IR spectrum of **4** in KBr.

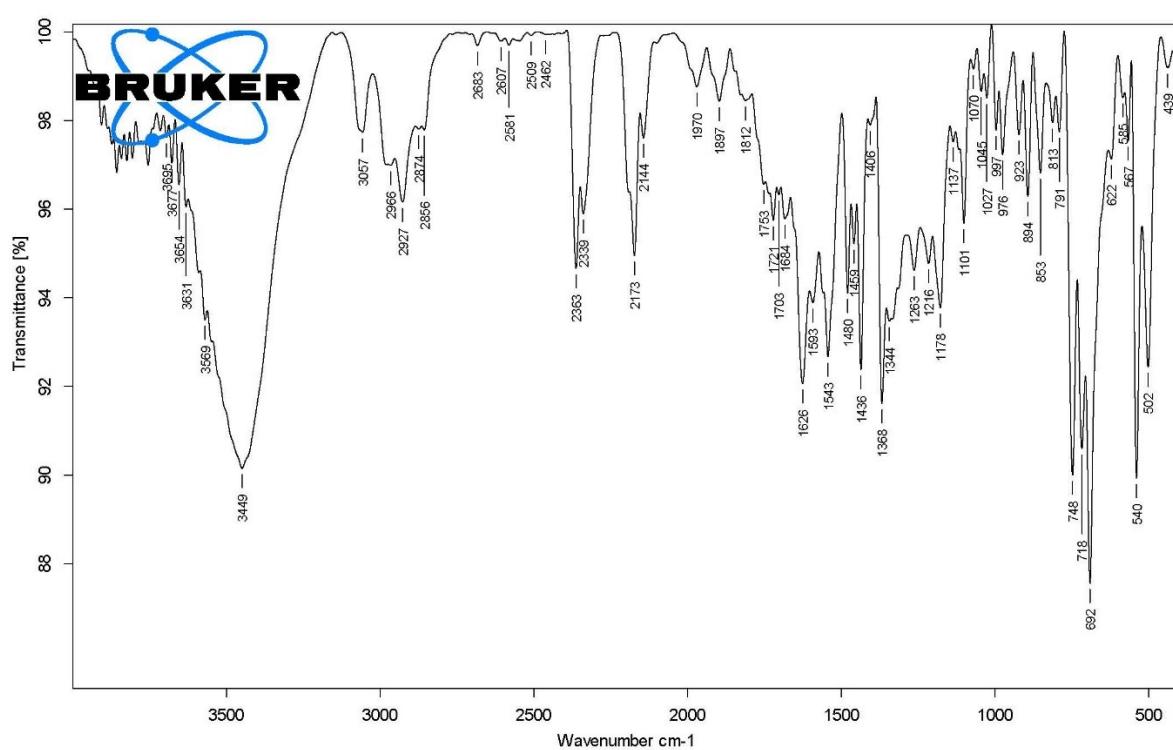

**Figure S13.** FT-IR spectrum of **7** in KBr.

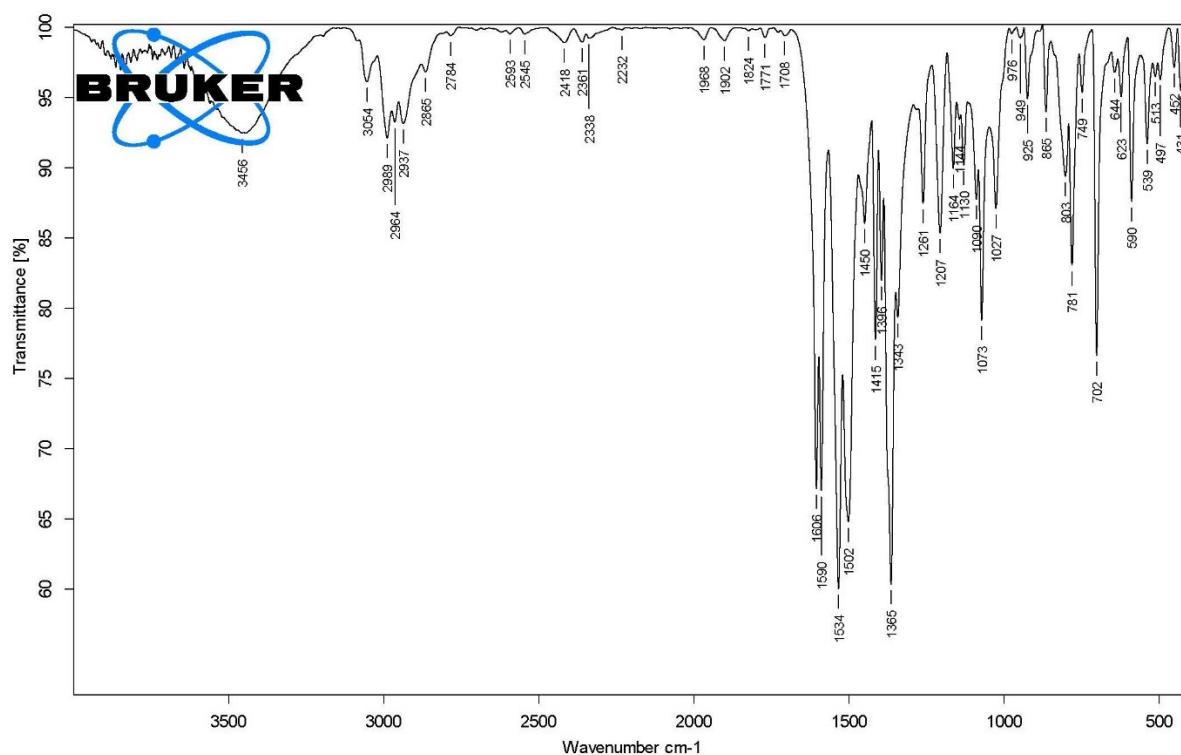

**Figure S14.** FT-IR spectrum of **8** in KBr.

**Figure S15.** FT-IR spectrum of **9** in KBr.

**Figure S16.** FT-IR spectrum of **11** in KBr.

**Figure S17.** FT-IR spectrum of **13** in KBr.
