2. <sup>1</sup> H and <sup>13</sup> C NMR spectra of intermediates <b>2, 6, 9, 13, 15</b> and organocatalysts <b>3, 5, 8, 14, 16</b>	S3
3. <sup>1</sup> H and <sup>13</sup> C NMR spectra of cyclic carbonates <b>18a-g</b>	S13

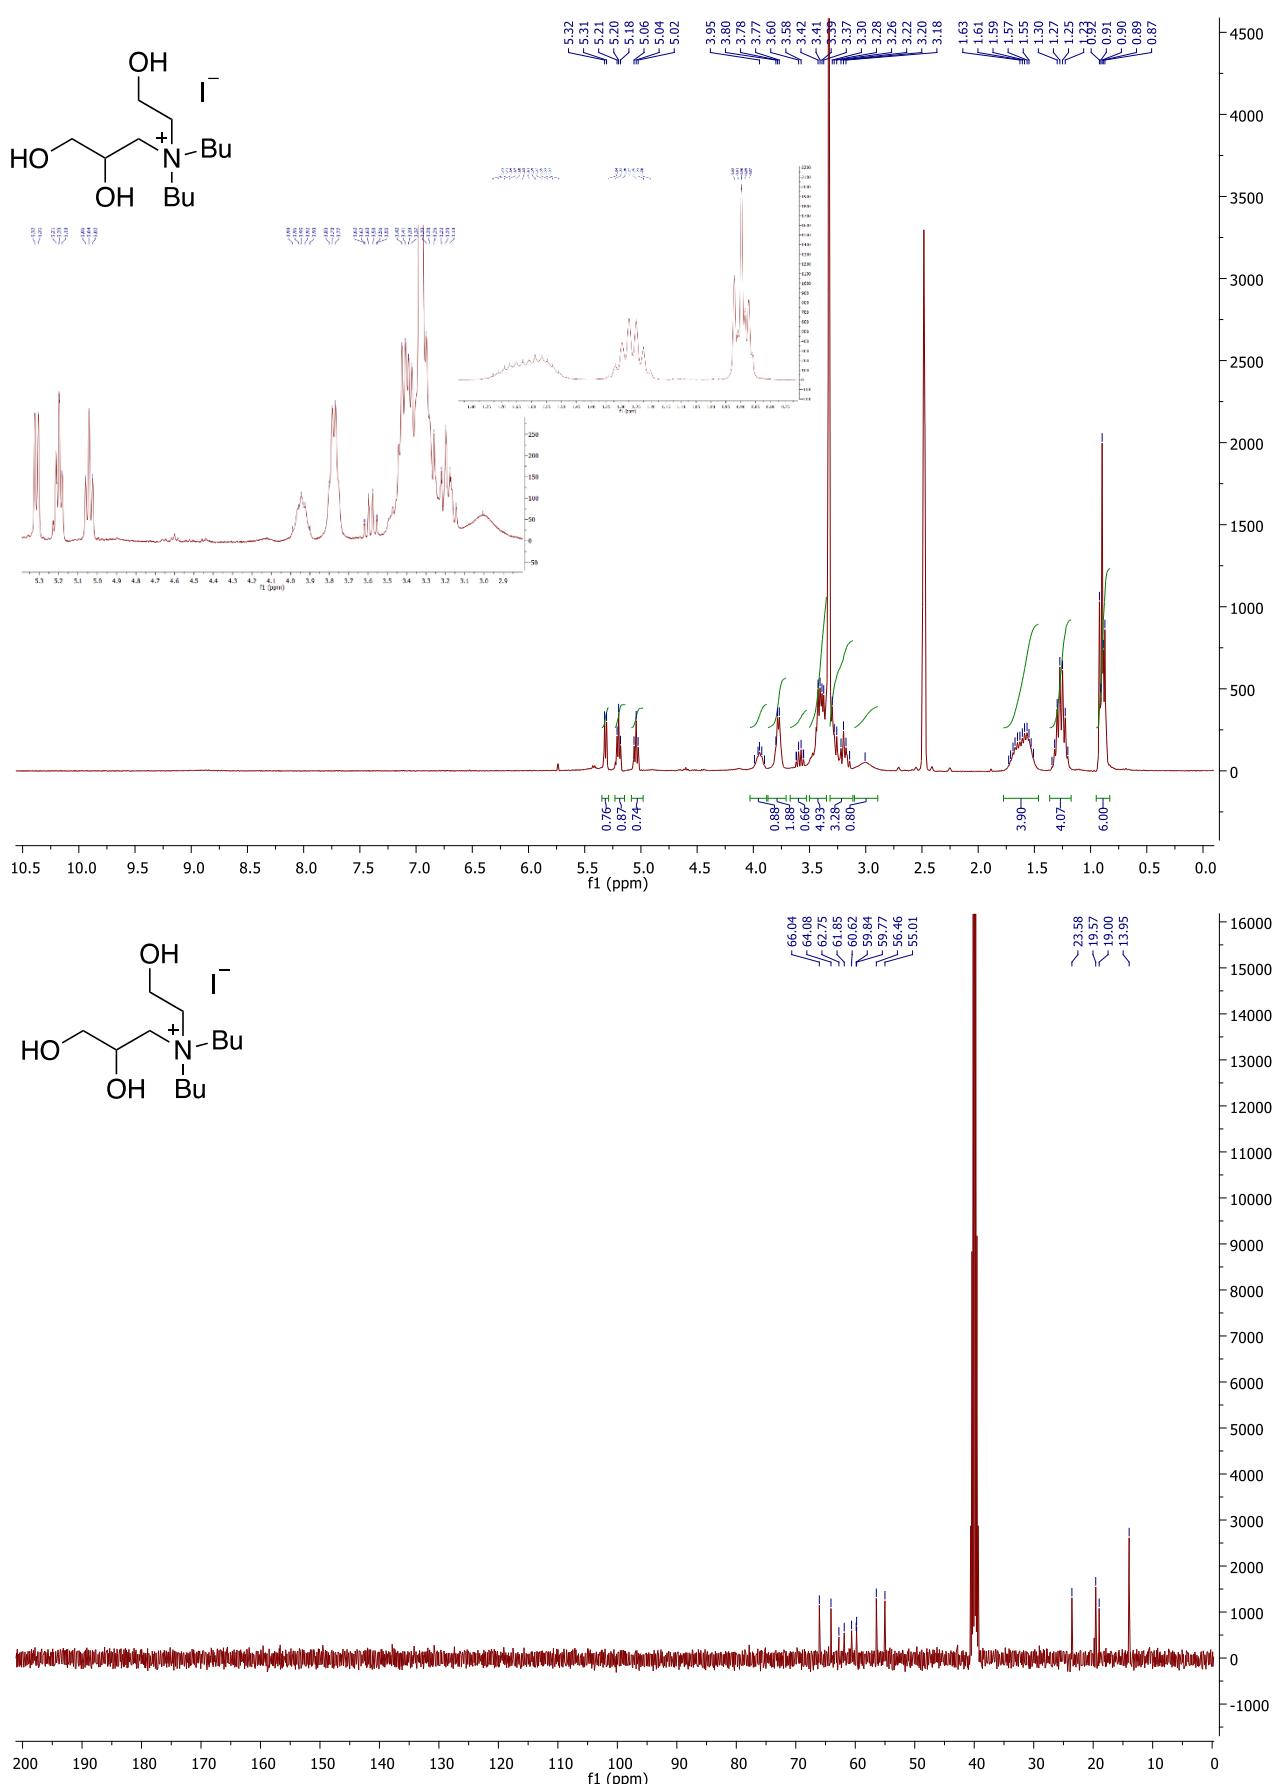

**Figure S1. Flow apparatus**

The volume of gaseous CO<sub>2</sub> is controlled by the mass flow controller (MFC) and mixed with the liquid phase in a T-mixer. The reactor consists of a 4.42 mL spiral capillary (FEP tubing; 0.75 mm internal diameter; length 10 m) placed inside a thermostated bath. The liquid flow rate is controlled by a HPLC pump while the back-pressure regulator (BPR) maintains a constant pressure of CO<sub>2</sub> (8.5 atm) throughout the system.
