

## Supplementary Material

**Table 1 and Table 2.** Backbone RMSD values (in Å) between the predicted decoys and the corresponding X-ray structure for CR6261 (supplementary Table 1) and F10 (supplementary Table 2). RMSD values of the most accurate decoy for any combination of starting structures are shown. The first two columns indicate the starting structure used for hemagglutinin (HA) and antibody (Ab); “unbnd” stands for unbound; PIGS is the model generated with the “same antibody” option and the Rosetta models are indicated as described in the text. The third column indicates the rank of the most accurate decoy so that 1 is the best scoring decoy, 2 the second scoring decoy and so forth. The last column shows the RMSD of the best scoring decoy, calculated for both the heavy and light chain. Combinations of starting structures in which the best scoring decoy is also the most accurate are highlighted.

**Supplementary Table 1.** Docking simulations of CR6261 in complex with Hemagglutinin.

| HA    | Ab    | Rank of most accurate decoy | H & L chain | Light chain | Heavy chain | CDR loops (all) | CDR loops (Lc) | CDR loops (Hc) | L1  | L2   | L3  | H1  | H2  | H3  | RMSD of best scoring decoy |
