The average 72 h IC₅₀ values of different MSAs in the parental 1A9 cell line and cloned mutant cell lines are presented as the mean IC₅₀ value ± SEM (n = 3 or more biological replicates). The resistance ratio (Resist Ratio) of the mutant cell line relative to the parental 1A9 cell line is presented in bold (mean ± SEM). Resist Ratio *p*-values are from a one-sample *t*-test. A resistance ratio of 1.0 demonstrates no difference in the IC₅₀ value between the two cell lines; a value below one shows that the mutant cell line is more sensitive to the MSA; a value greater than one indicates that the mutant cell line is resistant to the compound. Some of the IC₅₀ values for LAU treatment of 1A9-L4 cells were obtained from Dr Arun Kanakkanthara.
