

Supplementary Figure 1. Effects of suppression of FASN by FASN-specific siRNA (si-*Fasn*) on the levels of major lipogenic genes in the HCC4-4 derived mouse HCC cell line, as assessed by quantitative real-time RT-PCR. Experiments were conducted three times in triplicate. Tukey–Kramer test: at least $p < 0.01$; a, vs. Scramble; b, vs. si-*Fasn* 24 h.
