List of abbreviations

adj - adjusted

CI - confidence interval

FDR - false discovery rate

HVS - hypervariable segment

LCR - low complexity region

Max - maximum

Min - minimum

mtDNA - mitochondrial DNA

N - number

NUMT - nuclear insertion of mitochondrial DNA

PCP - PrecisionCallerPipeline

Poly-C - poly-C stretch

TSS - Ion Torrent Suite™ Software

VCM - variant calling method

VL - variant level

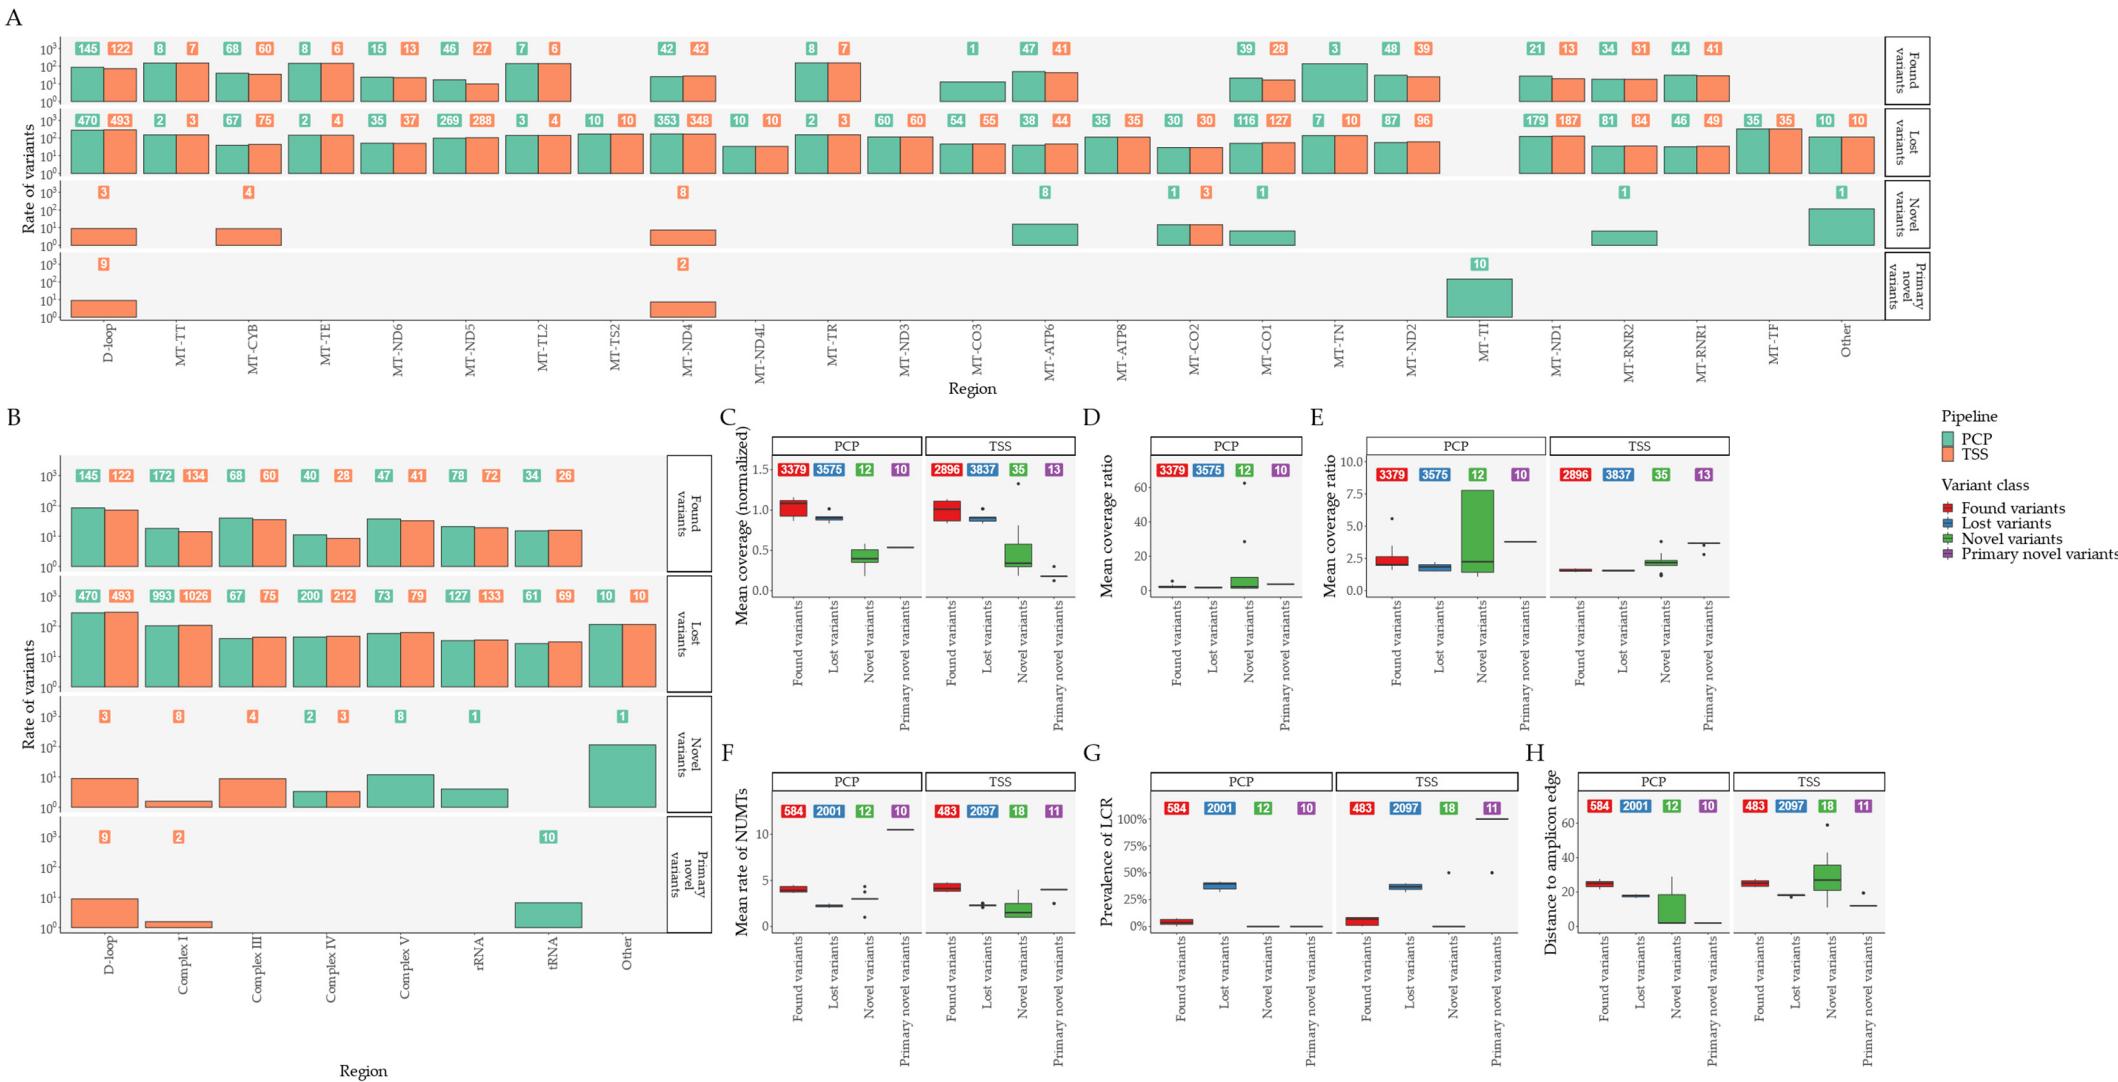

Figure S4 - Differences between different variant classifications, per pipeline.

(A) Relative variant burden of different mtDNA regions, per pipeline and per variant classification; (B) Relative variant burden of different macro mtDNA regions, per pipeline and per variant classification; (C) Mean normalized coverage per sample, per pipeline and per variant classification; (D) Mean coverage ratio per sample in PCP, per variant classification; (E) Mean coverage ratio per sample, per pipeline and per variant classification, with a close-up of Figure S4D regarding PCP; (F) Mean rate of NUMTs per sample, per pipeline and per variant classification; (G) Mean prevalence of low complexity region (LCR) variants per sample, per pipeline and per variant classification; (H) Mean distance to “callable” amplicon edge per sample, per pipeline and per variant classification. Labels above the columns/boxplots represent the number of variants for each x-value. Region *Other* refers to positions in rCRS with an overlap between the two strands or unannotated. For the mean normalized coverage and for the mean coverage ratio, we considered all variants from both the primary and the mixture analysis, including the output from the Illumina sequencing; otherwise, it would not be possible to have coverage and its ratio for false negatives.

Table S15 - Mixture analysis: Relative burden of different macro variants in different mtDNA regions, depending on the VCM chosen. All regions

| VCM | Pipeline | Macro variant description | Macro region | Region | Relative burden |
|-----------|----------|---------------------------|--------------|---------|-----------------|

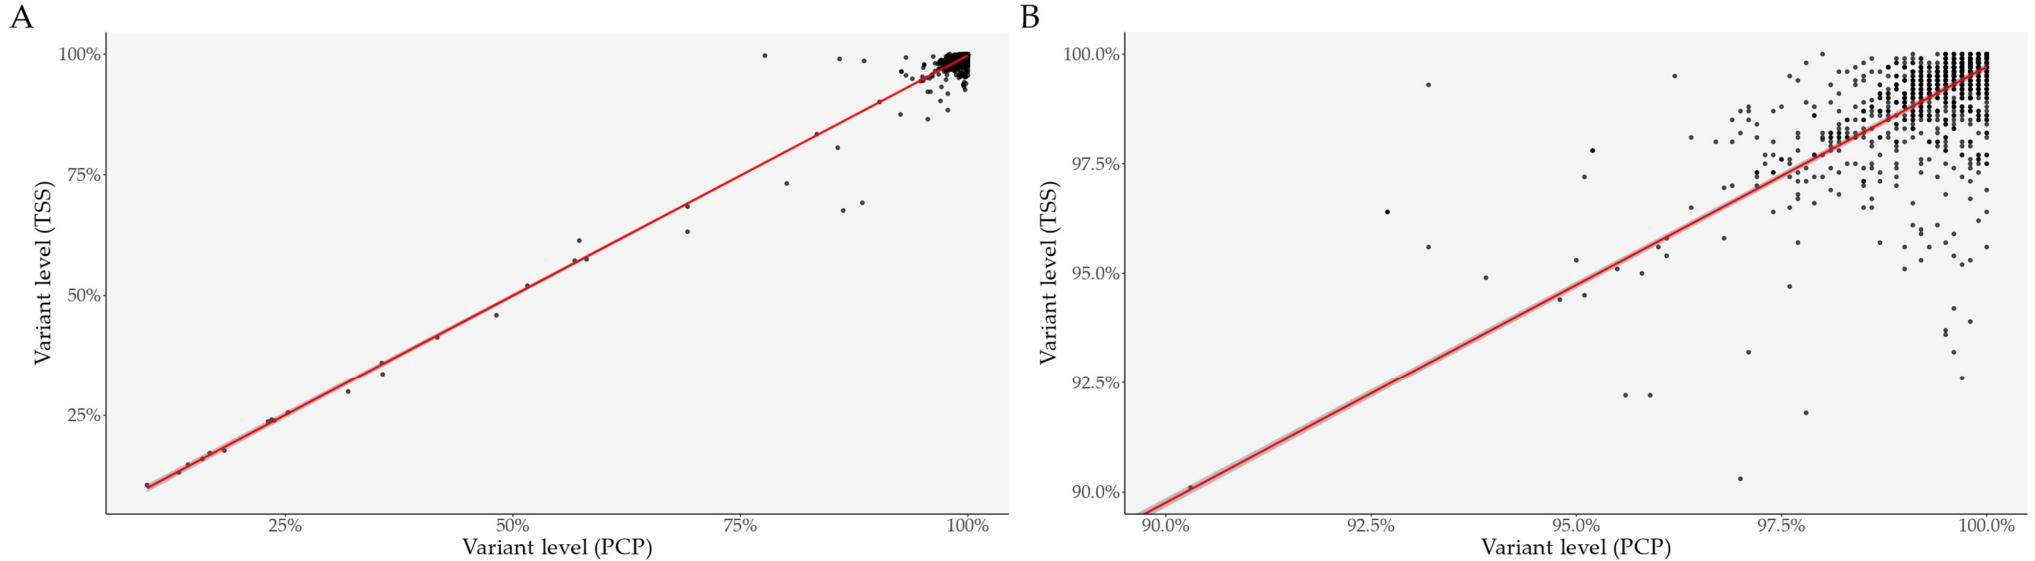

Figure S5 - Ion Torrent sequencing of an independent set of 50 clinical samples: Linear regression model between the variant level in PCP and the variant level in TSS, for variants found in both PCP and TSS.

(A) Linear regression model between the variant level in PCP and the variant level in TSS for all variants found in both PCP and TSS, (B) Close-up of Figure S5A, focusing on homoplasmic variants.
