Table S1. List of lipid species identified by lipidomics in melanocytic cells, along with the relative intensity in each independent sample and the corresponding peak markers (mass to charge ratio (*m/z*) and retention time (RT) pairs). Whenever possible, annotation of identified fatty acids was performed at the *sn* position-level. The ether (O) and vinyl ether (P) bonds of alkyls at the *sn*-1 position of the glycerol backbone were also characterized. HeM, human epidermal melanocytes; NM, nevi melanocytes; PM, primary melanoma; MM, metastatic melanoma. PC, phosphatidylcholine; PC(O/P), ether phosphatidylcholine; LPC, lysophosphatidylcholine; SM, sphingomyelin, Cer, ceramide; HexCer, hexosylceramide; CE, cholesteryl ester; TG, triglyceride; DG, diglyceride; PE, phosphatidylethanolamine; PE(O/P), ether phosphatidylethanolamine; LPE, lysophosphatidylethanolamine; PI, phosphatidylinositol; PG, phosphatidylglycerol; PS, phosphatidylserine; FA, fatty acid.

Table S2. Ultra-High Performance Liquid Chromatography (UHPLC) and Mass Spectrometry (MS) settings.

Figure S1. Screening for lipid species with significant change in relative abundance using volcano plot analysis and heatmap clustering. To identify lipids differentially expressed between the groups, volcano plots and heatmap clusters with fold-change > 2 and *p*-value ≤ 0.05

by Student's *t*-test using Benjamini-Hochberg as a multiple testing correction were also performed. Heatmap clustering was visualized for fold-change of potential lipid biomarkers in all ESI+ and ESI- comparisons, showing the level of relative increase (red) and decrease (blue) in peak intensity. In volcano plots, red and blue indicate up- and down-regulated species, respectively. HeM, human epidermal melanocytes; NM, nevus melanocytes; PM, primary melanoma; MM, metastatic melanoma.

Figure S2. Relative abundance of four selected lipid species. The relative abundance of some lipid species increases in neoplastic melanoma, as exemplified by phosphatidylcholine ethers PC O-16:0/18:1 and PC O-16:0/16:0 (**A**), whereas abundance of other lipids decrease markedly, as it occurs with sphingomyelin SM d18:1/16:0 and the phosphatidylethanolamine ether PE P-18:0/22:4 (**B**).

Figure S3. The relative abundance of some lipid classes differ significantly among the cell groups. Relative abundance of the total PC, PC(O), LPC, PE, PE(P), LPE, PI, PG, and PS (**A**), and of the total Cer+, Cer-, SM, HexCer, FA, CE, TG and DG (**B**). The data were estimated as the sum of the intensity values shown in Table S1 and they are expressed as the mean \pm SD. Multiple comparisons were performed by one-way ANOVA with a multiple testing correction test. The table in **C** shows the *p*-values for the Levene test to determine variances equivalences used to select the post-hoc method (Tukey if $p \geq 0.05$ and Games-Howell if $p \leq 0.05$), one-way ANOVA *p*-values, and Tukey's or Games-Howell's¹ test *p*-values for the six pairwise comparisons with the minimum significance in the comparison. * $p \leq 0.05$; ** $p \leq 0.01$; *** $p \leq 0.001$; NS, not significant. The numbers highlighted in red and blue denote significant increases and decreases, respectively. HeM, human epidermal melanocytes; NM, nevus melanocytes; PM, primary melanoma; MM, metastatic melanoma.

Figure S4. Lipid identification workflow. (**A**) Fragmentation scheme of PI ions; (**B**) extracted ion chromatogram of [PI(18:1/20:4)-H]⁻ in lipid extracts of human melanocytic cells samples; (**C**) MS/MS spectrum of [PI(18:1/20:4)+NH4]⁺ in ESI+ and (**D**) of [PI(18:1/20:4)-H]⁻ in ESI- , and (**E, F**) comparison of the exact masses of precursor ions and unknown lipid products with those of a database and annotation.

Figure S5. MS/MS spectra of the precursor ions of three representative species of PC, PE, PI, PS and PG. For PC (**A**) and PE (**B**), the intensity of the carboxylate ion peak corresponding to the FA at the *sn*-2 position was always higher than that at *sn*-1. However, the relative intensity of carboxylate product ions displayed in the MS/MS at the *sn*-1 was more intense than that at *sn*-2 fatty acyls for PI (**C**), PS (**D**) and PG (**E**).

Table S1. List of lipid species identified in the positive and negative ion mode along with their corresponding peak markers (mass to charge ratio (m/z) and retention time (RT) pairs) and relative abundance in each independent sample.

Note: In this file, decimals are represented by commas.

Lipid class	Lipid species (as adduct)	C in FA	Double bonds in FA

Table S2. Ultra-High Performance Liquid Chromatography (UHPLC) and Mass Spectrometry (MS) analysis settings.

UHPLC	MS
ACQUITY UPLC (Waters)	Quadrupole time of flight (Q-TOF) model SYNAPT G2 HDMS (Waters)
Pre-column: Acquity UHPLC HSS T3 1.8 µm VanGuardT (Waters)	Ionization mode: ESI positive and ESI negative
Column: Acquity UHPLC HSS T3 2.1x 100 mm, 1.8 µm (Waters)	Adquisition mode: continuun MS ^E in resolution mode (FWHM≈20,000)
Column temperature: 65 °C	Capilar voltage: 0.7 kV (ESI ⁺) and 0.5 kV (ESI ⁻) Cone voltage: 35 V
Flux: 500 µl/min	Source temperature: 120 °C Desolvation temperature: 400 °C
Mobile phase A: acetonitrile/H ₂ O (40:60) with 10 mM NH ₄ Ac	Desolvation gas: argon, 900 l/h Cone gas : argon, 30 l/h
Mobile phase B: acetonitrile/isopropanol (10:90) with 10 mM NH ₄ Ac	Acquisition range: 50 to 1200 u.
Gradient: 0-10 min, from 40 to 100% B 10-11 min and final re-equilibration of the system, 100% B	Scan time: 0.5 s Inter-scan delay: 0.024 s
Automatic injector temperature: 4 °C Injection volume: 7.5 µl	Colission energy: Function 1: trap 6 eV and transfer 6 eV Function 2: trap ramp from 15 to 40 eV and transfer 6 eV
