Differential Therapeutic Effect of Extracellular Vesicles Derived by Bone Marrow and Adipose Mesenchymal Stem Cells on Wound Healing of Diabetic Ulcers and Correlation to Their Cargoes.

Margherita A. C. Pomatto¹, Chiara Gai¹, Federica Negro², Massimo Cedrino³, Cristina Grange¹, Elena Ceccotti¹, Gabriele Togliatto¹, Federica Collino⁴, Federico Figliolini³, Tatiana Lopatina¹, Maria Felice Brizzi¹, Giovanni Camussi^{1*}.

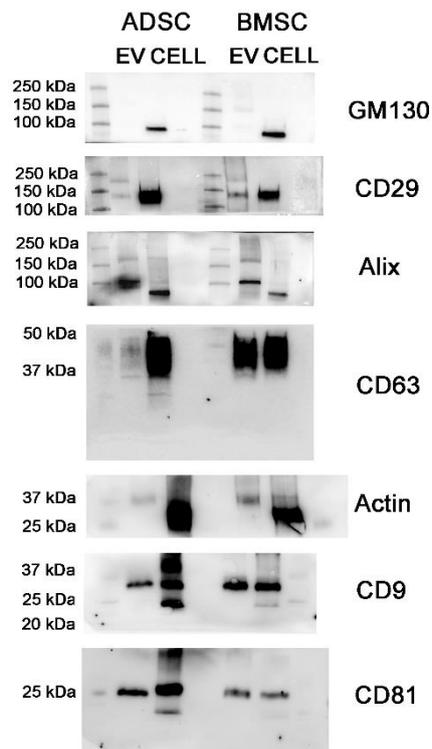

Figure S1. Western Bolt Membranes of BMSC and ADSC-EV Characterization. Images of western blot membranes used in Figure 1 to show MSC-EV characterization.

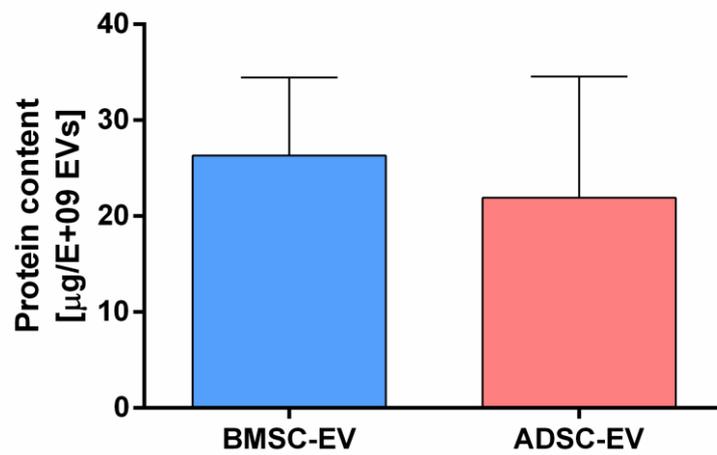

Figure S2. Protein content of BMSC and ADSC-EVs. Quantitative analysis of total proteins contained in BMSC and ADSC-EVs. Proteins were isolated by EV preparation and measured using BCA assay as described in the 'Materials and Methods' section. Data are expressed as mean \pm standard deviation.

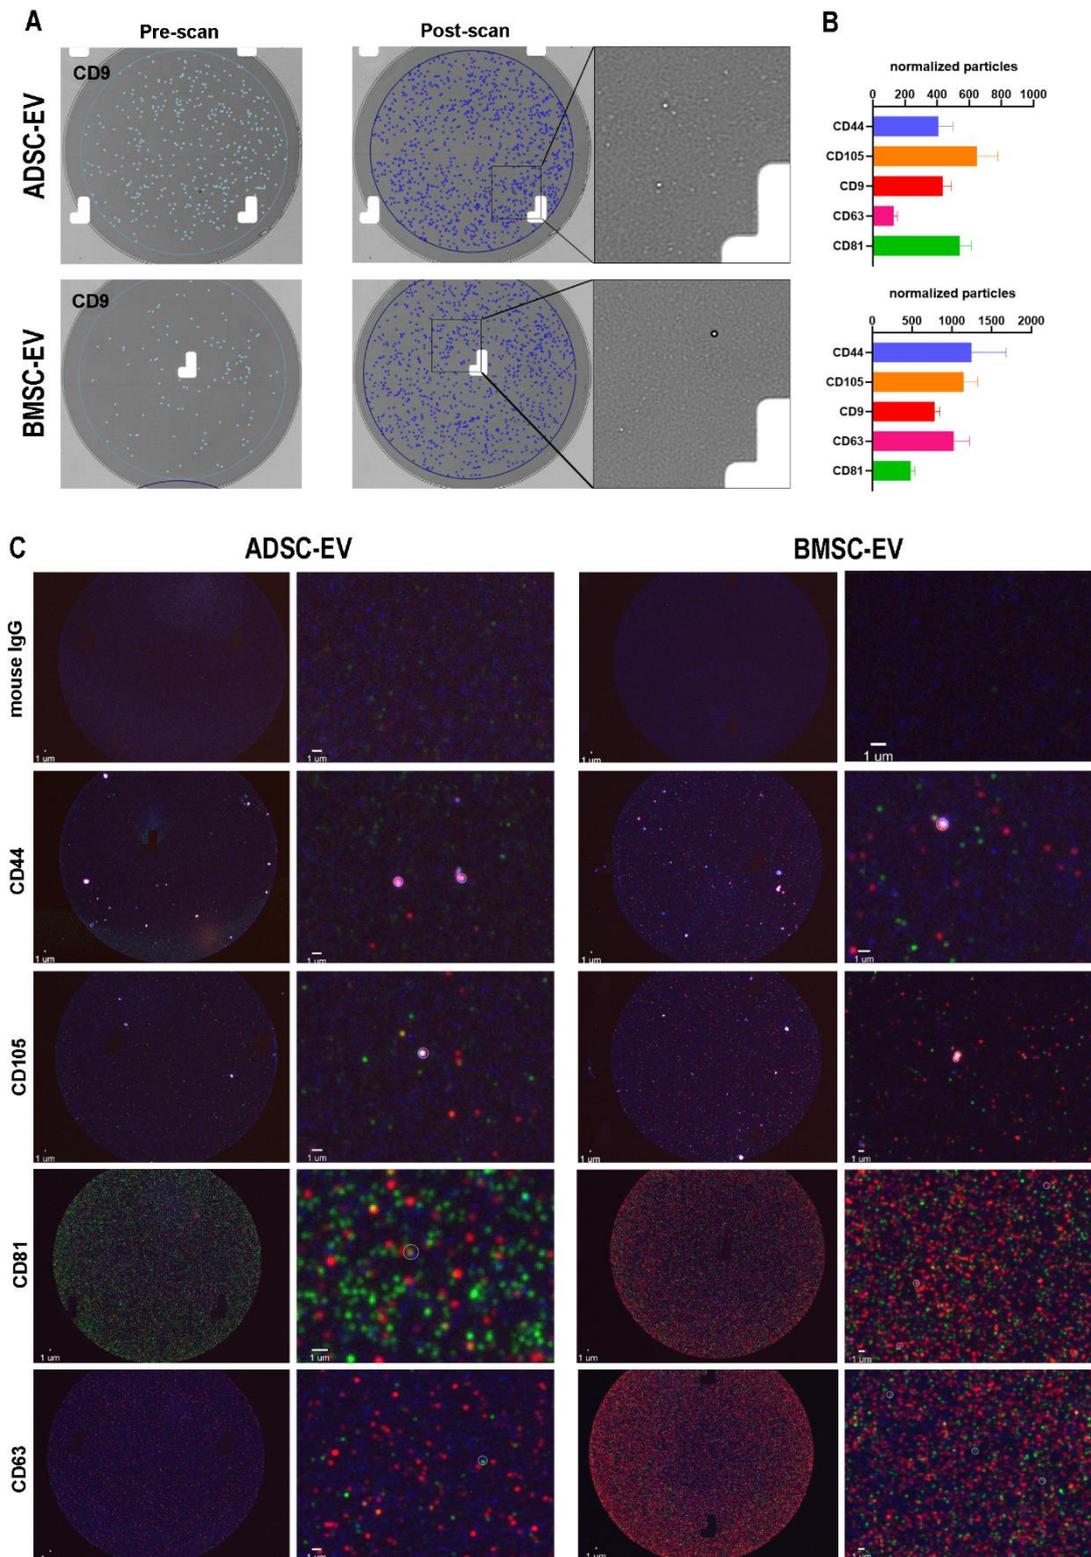

Figure S3. Characterization of ADSC and BMSC-EVs by ExoView®. (A) Interferometry images of a representative anti-CD9 capture spot pre-scan (left) and post-scan (right) for ADSC-EVs (first row) and BMSC-EVs (second row). Blue circles indicate EVs detected by interferometry. A magnified image of post-scan spot

is shown on the right; (B) The histograms show the number of normalized particles counted by interferometry for each capturing antibody. Bars show mean \pm SD of 4 chips for each type of EV, each chip contains three spots for each capturing antibody; (C) Representative images for EV detection by fluorescence for ADSC-EVs (left columns) and BMSC-EVs (right columns). Images show capture spot with anti-mouse IgG, anti-CD44, anti-CD105, anti-CD81, anti-CD63. For each EV groups, images on the left show a magnified field of the image on the right. White circles highlight single EV particle stained with either CD9 (red), CD63 (blue), and CD81 (green) confirming the colocalization of the three markers on the same EV. Scale bars of 1 μ m are shown on each image.

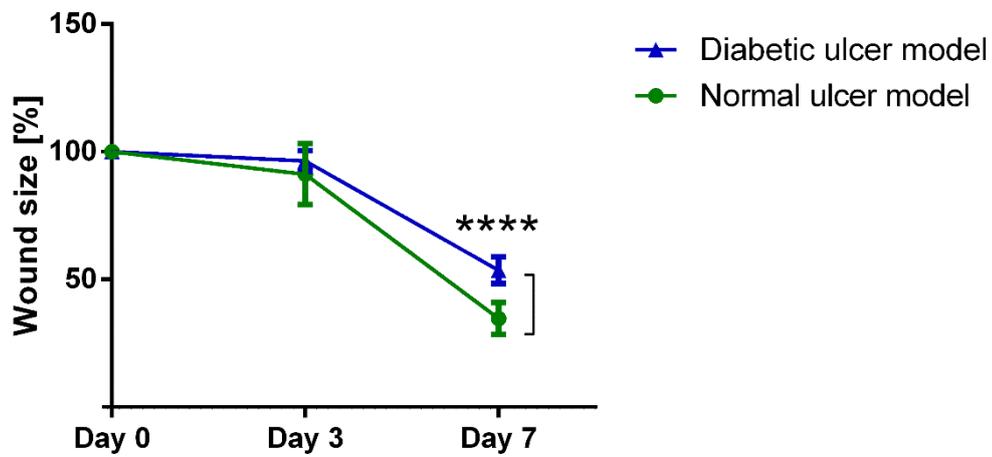

Figure S4. Comparison of Skin Wound Healing on Normal and Diabetic Ulcers. Quantitative analysis of wound size in models of ulcers in normal and diabetic mice. Full-thickness excisional wounds were made at day 0 and wound area were measured at 3 and 7 days and expressed as percentage in comparison to initial area at day 0. ****: $p < 0.0001$ between normal and diabetic model at day 7.

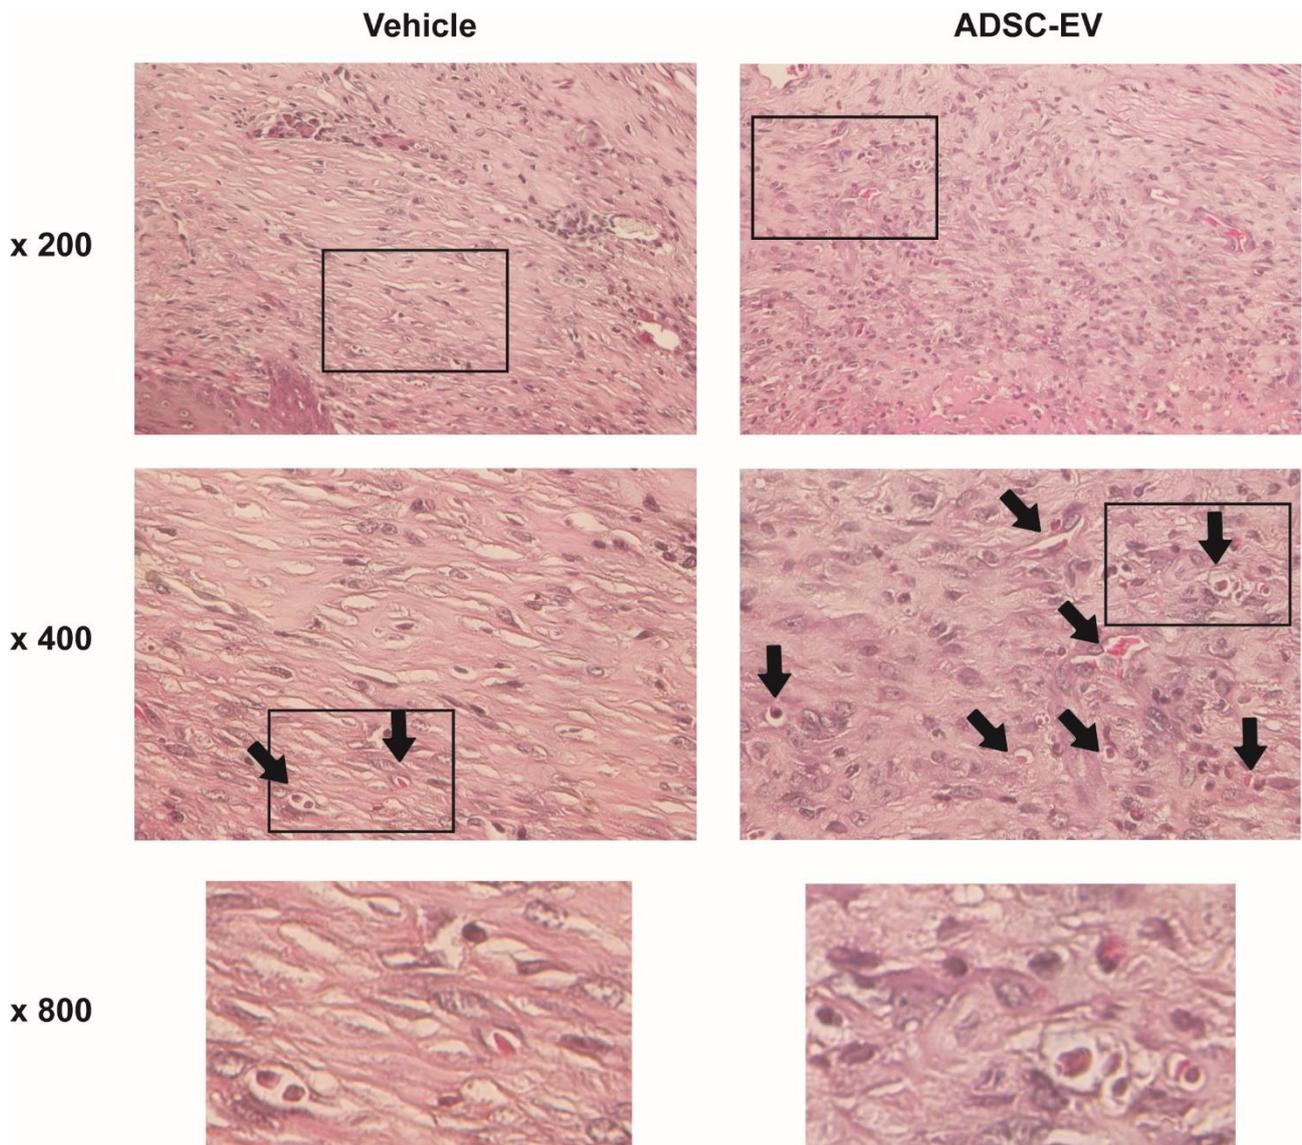

Figure S5. Hystological analysis of blood vessels in diabetic mice treated with ADSC-EVs. Representative images of H&E staining at different magnification (x 200, x 400 and x 800) and detection of vessels present in wound sections. Black arrows indicate vessels in the micrograph. Black rectangles indicate the site of magnification.

Table S1: miRNAs Carried by ADSC-EVs and MSC-EVs.

miRNA expression levels detected by qRT-PCR in three EV samples from ADSC and BMSC-EVs. Data were obtained by human TaqMan® Array Human MicroRNA Card and are expressed as cycle threshold (Ct). Absence of Ct value indicates that miRNA was not expressed in the sample.

miRNA	BMSC-EV 1	BMSC-EV 2	BMSC-EV 3	ADSC-EV 1	ADSC-EV 2	ADSC-EV 3

Table S2: Target Pathways of miRNAs Carried Only by ADSC-EVs.

The list of miRNAs only present in ADSC-EVs was analyzed by mirPath v.3 [33]. The columns show the p-value, the number of target genes in the pathway, and the number of miRNAs involved. Highlighted pathways have been selected and showed in Figure 3.

KEGG pathway	p-value	genes	miRNAs
TGF-beta signaling pathway	1.26E-05	64	48
ErbB signaling pathway	4.64E-05	73	52
