*Cells from patients 1 to 19 were stimulated with AV, while cells from patients 20 to 29 were stimulated with EBV

NA: Not applicable

GD: new gadolinium-enhanced lesion without clinical manifestation

Supplementary Figure S1. Paired Wilcoxon tests of relapse and remission cells from each subject (CD4+, CD8+ and Treg cells) to stimulation with VZV, AV or EBV. Comparison of the T cell response to VZV ($n = 22$), AV ($n = 13$) and EBV ($n = 9$) between paired REL-MS and REM-MS samples show higher proliferation trends of effector CD4+ and CD8+ T lymphocytes during remission, with statistical significance only in CD8+ T cells when stimulated with AV (A-F). For Treg cells, there was no difference between relapse and remission status. (G-I). Each dot represents one subject. ** $p < 0.01$.
