Supplemental Figure S5

Supplemental Figure S5. Local microinjection of EVs into embryos of zebrafish. A) Immuno-detection assay (anti-l-plastin) in trunk area (lateral view) of embryos treated with CFSE-stained EVs. A scheme of injection strategy is reported. Representative fluorescence overlaid with brightfield images shows macrophage (red) and EV (green) recruitment at the injection site (dashed line) 6 hpi. B) Macrophage quantification (l-plastin positive signal area) in dashed line area at 6 hpi; the mean values of l-plastin positive signal area per embryo ± SEM are indicated (VSMC^{WT}-EVs= 20 and VSMC^{PCSK9}-EVs= 16, from three independent biological replicates). Red bar represents the injection of VSMC^{PCSK9}-EVs; white bar represents the injection with VSMC^{WT}-EVs. Statistical significance was assessed by two-tailed unpaired Student's t test; scale bar 300 μ m. A.U., arbitrary unit; EVs, extracellular vesicles; hpi, hours post injection; SEM, standard error of the mean; VSMC^{PCSK9}-EVs, EVs released by VSMCs overexpressing PCSK9; VSMC^{WT}-EVs, EVs released by VSMCs wildtype.
