DEGs in CC in 4-week-cuprizone treated and control mice

DEGs in microglia in 4-week-cuprizone treated and control mice

DEGs in OPCs in 4-week-cuprizone treated and control mice

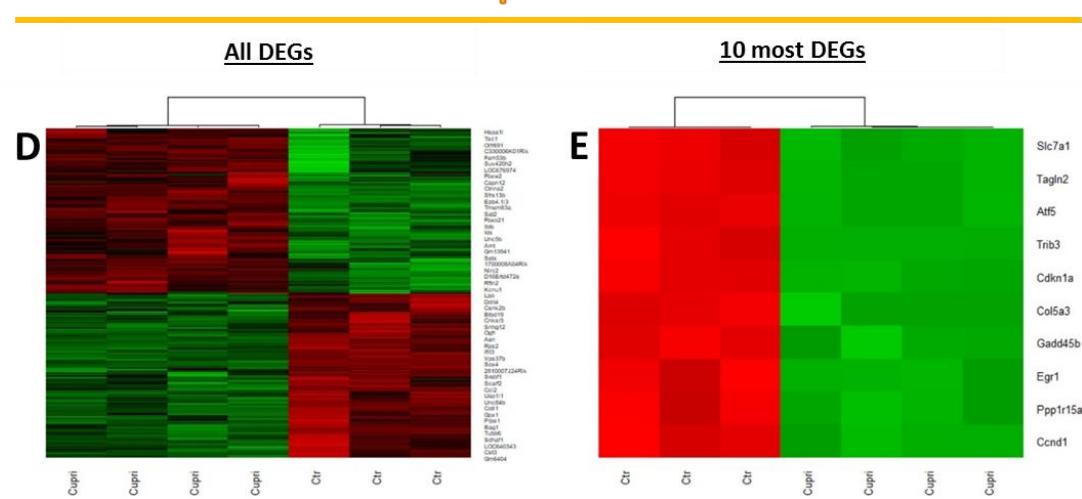

Figure S1. Sample clustering by expression of differentially expressed genes (DEGs) in *corpus callosum* (CC), microglia and oligodendrocyte progenitor cells (OPCs) samples of control mice and 4-week cuprizone-treated mice. Heatmap and hierarchical clustering were performed with the normalized and filtered expression data, using all DEGs and the 10 most DEGs. Color key indicates the relative expression level of genes across all samples: red color represents an expression level below mean, green color represents expression higher than the mean. (A-B) Analysis of CC samples and DEGs. (C) Analysis of microglia samples and DEGs. (D-E) Analysis of OPCs samples and DEGs.

Figure S2

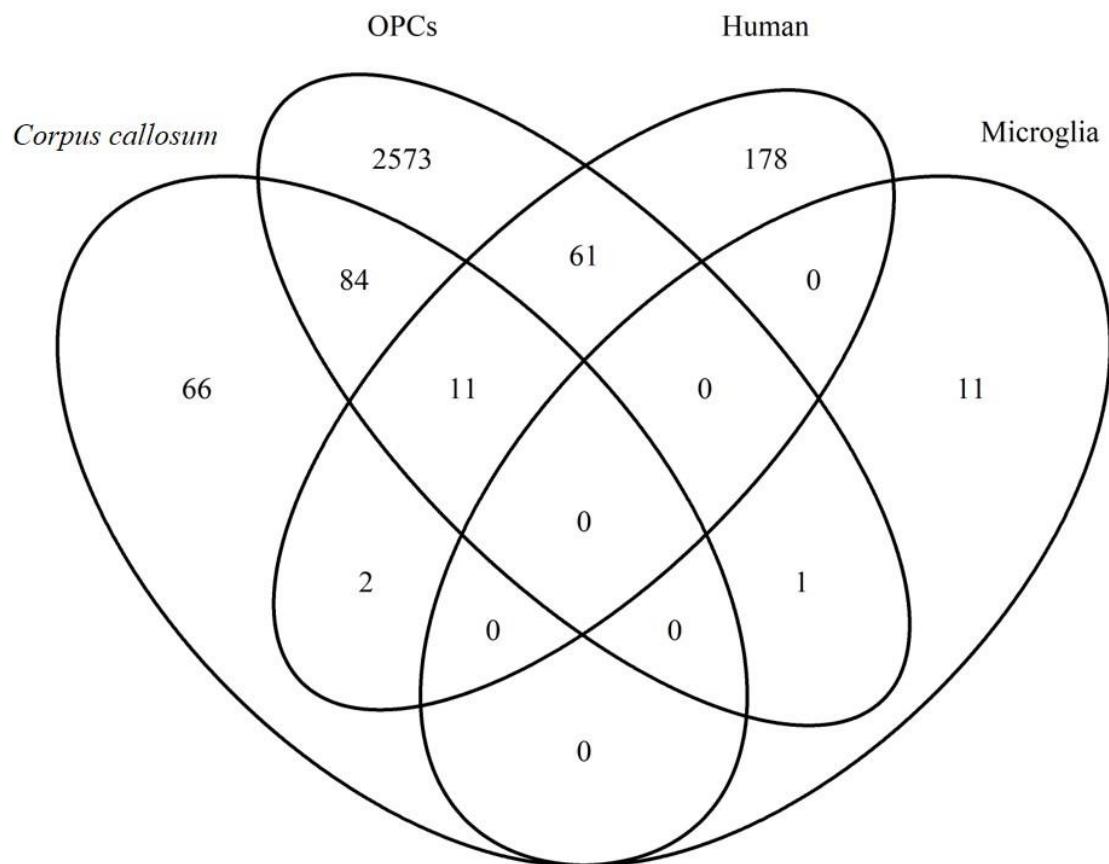

Figure S2. Common differentially expressed genes (DEGs) identified in white matter from multiple sclerosis (MS) samples and in corpus callosum (CC), microglia and oligodendrocyte progenitor cell (OPCs) samples from mice. Venn's diagram showing the number of common DEGs. Samples from CC and microglia were obtained after a 4-week treatment with cuprizone, while OPC samples were collected after a 5-week cuprizone treatment.
