Figures S1–S15

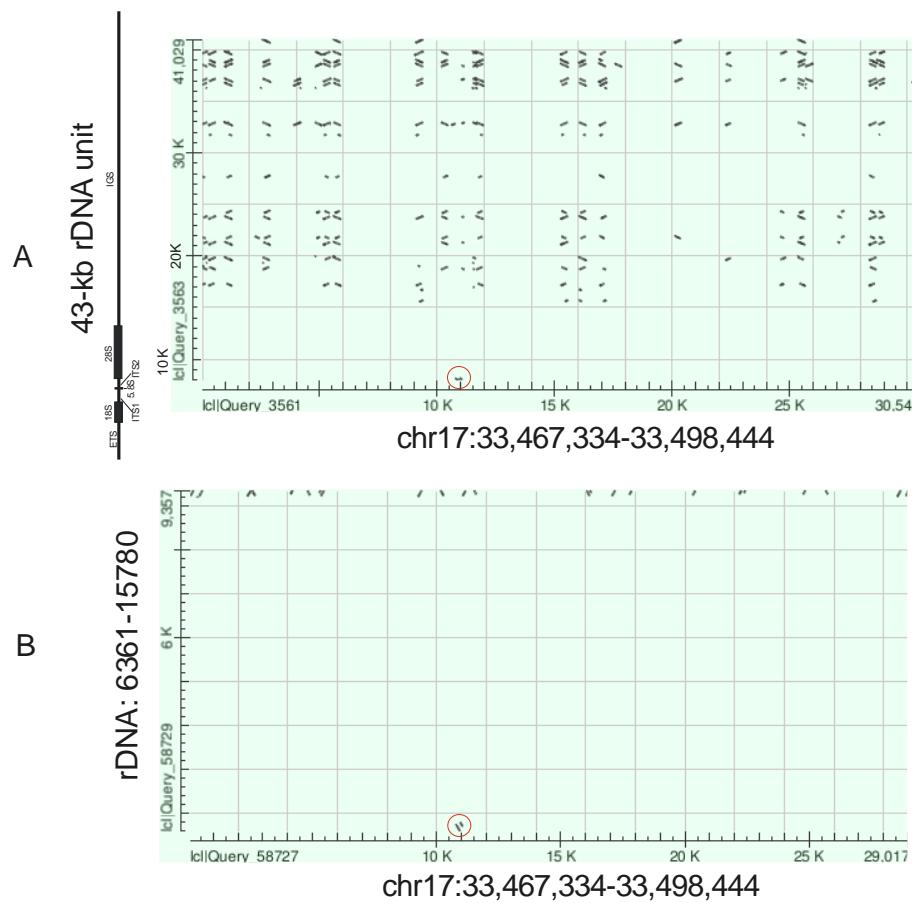

Figure S1. Dot plot showing homologous regions between the rDNA unit and a region of chr17 containing the *UNC45B* gene. (A) The complete 43-kb rDNA was used. The numbering in rDNA is according to the human ribosomal DNA complete repeating unit sequence (accession number: U13369). The red circle indicates the only homologous region from the transcribed portion of rDNA (7935–8146) corresponding to the 5' end of the 28S gene. (B) A fragment of rDNA sequence (6361–15780) and the same region of chr17 were used for dot plot to show the homology regions inside 28S RNA gene in more detail.

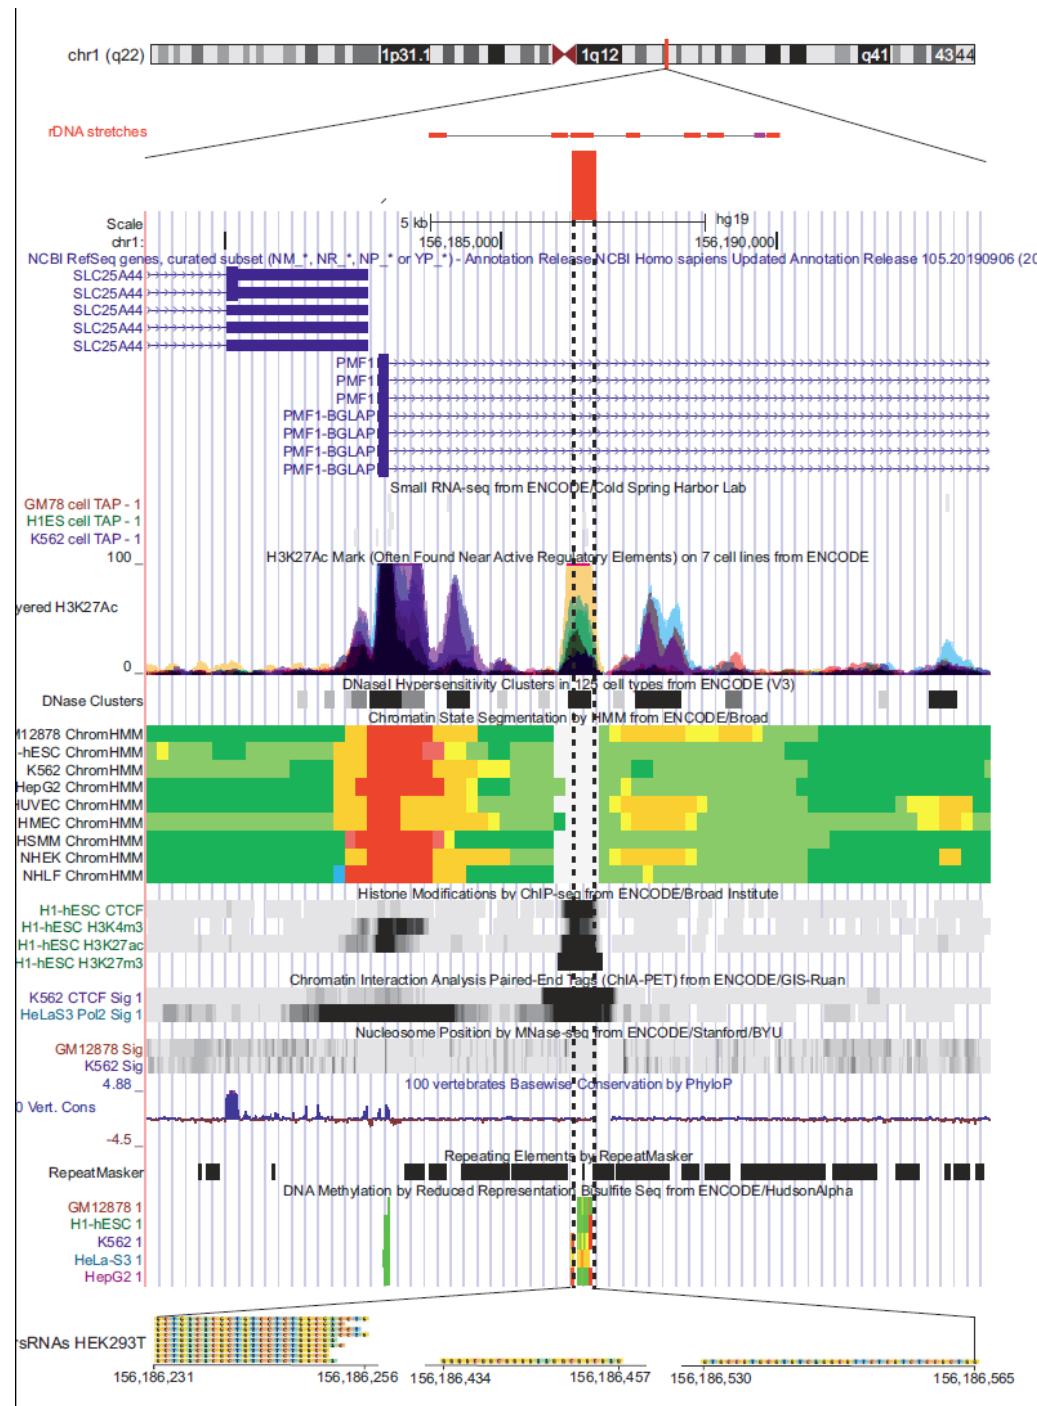

Figure S2. Characterization of the srRNA targets inside the intron of the *PMF1* gene. The distribution of layered H3K27ac marks, genome segmentation from ENCODE, histone modifications, nucleosome position, and CpG methylation inside a region of chr1 are shown as in the UCSC Browser. Sequences of 23–35-nt-long srRNAs from the ETS portion of the rDNA unit (see Fig. S3) are shown at the bottom.

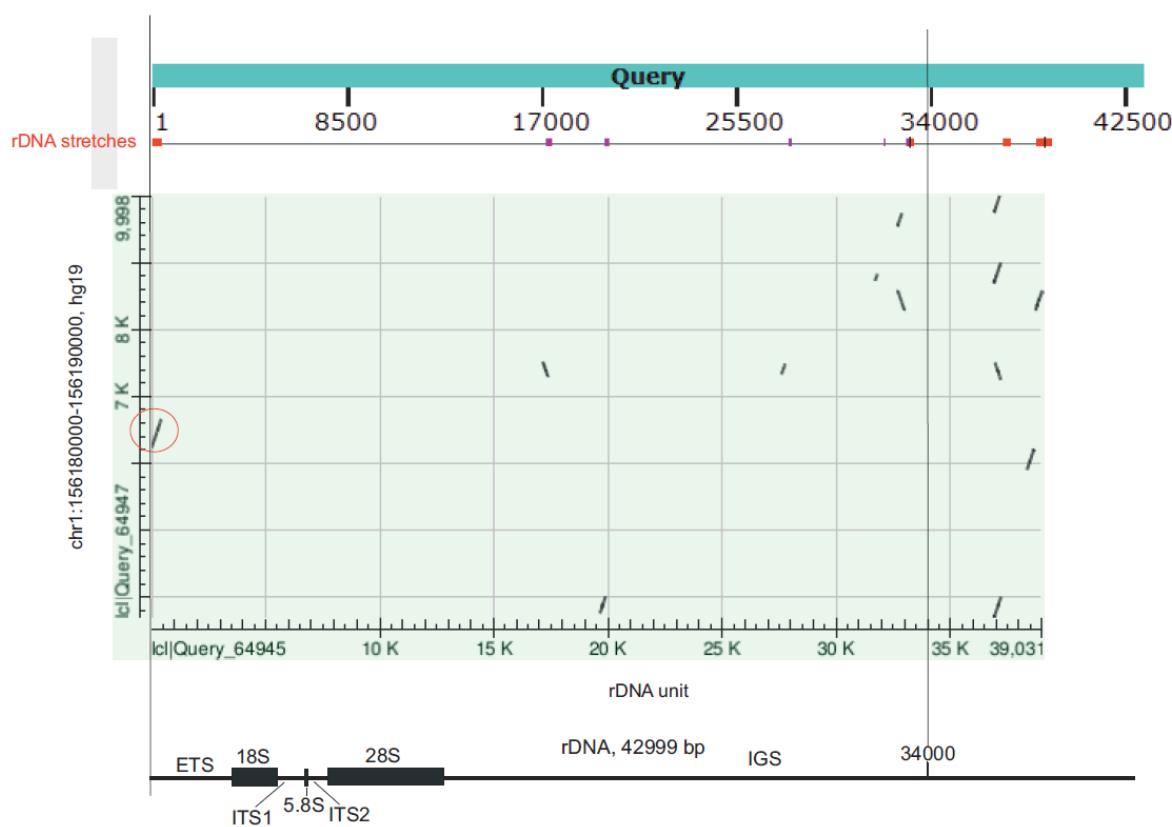

Figure S3. Dot plot showing homologous regions between the rDNA unit and the region of chr1 containing the *PMF1* gene. The numbering in rDNA is according to the human ribosomal DNA complete repeating unit sequence (accession number: U13369). The red circle on the Y-axis indicates the only homologous region from the transcribed portion of rDNA (1–331) corresponding to the very beginning of the ETS sequence. rDNA stretches are shown at the top.

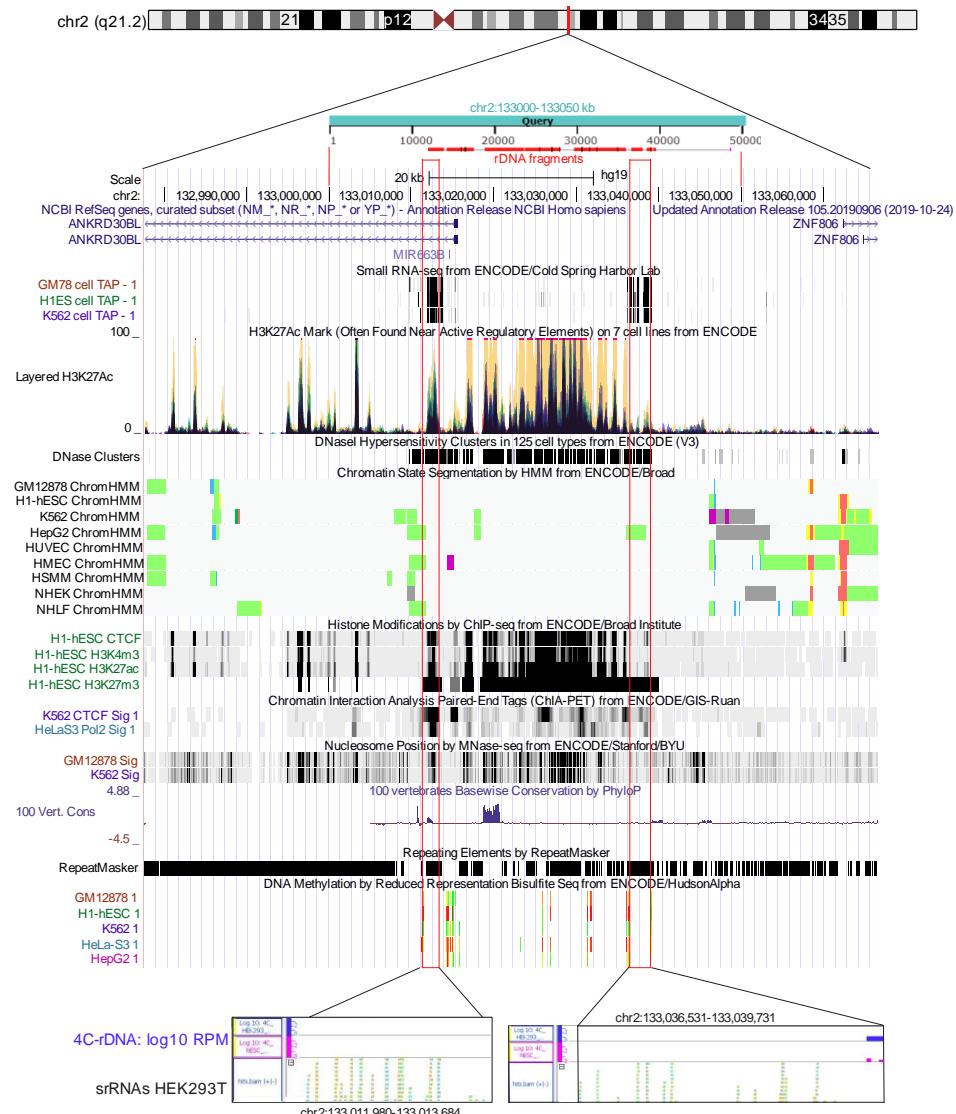

Figure S4. Characterization of the srRNA targets inside the intron of the ANKRD30BL gene and in the upstream region. The alignment of the genomic region with the rDNA unit is shown at the top. The distribution of layered H3K27ac marks, genome segmentation from ENCODE, histone modifications, nucleosome position, and CpG methylation inside a region of chr1 are shown as in the UCSC Browser. The distribution of 23–35-nt-long srRNAs is shown schematically at the bottom.

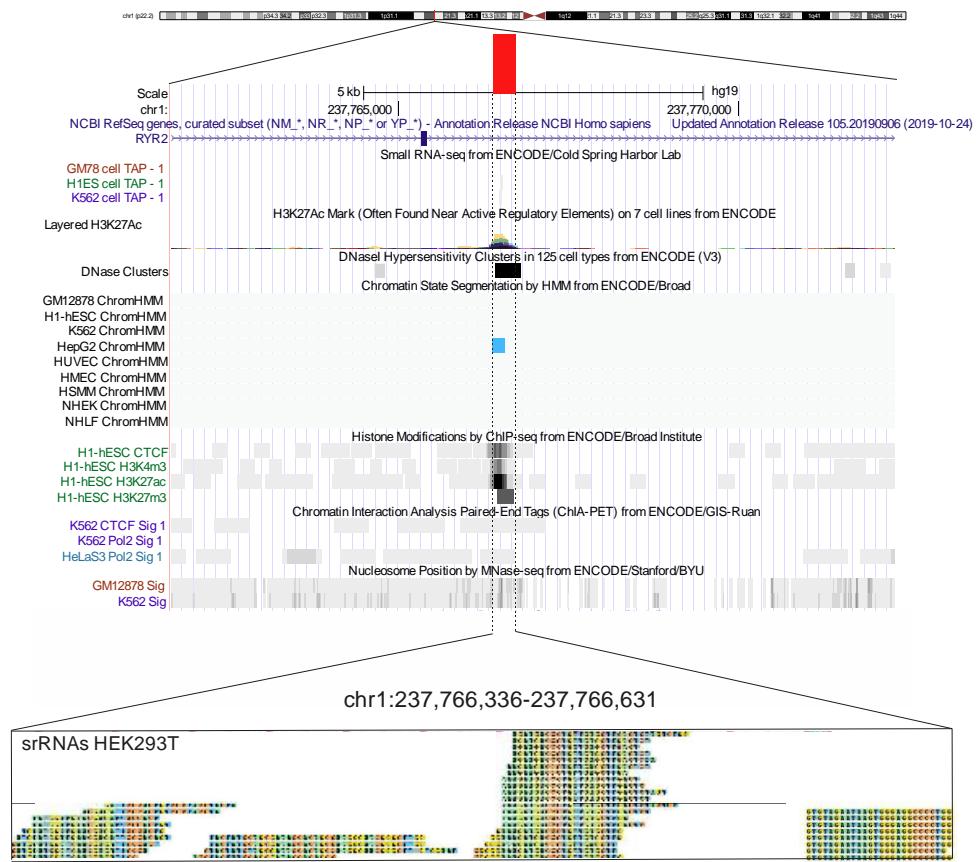

Figure S5. Characterization of the srRNA targets inside the intron of the RYR2 gene. The red bar at the top shows a region corresponding to srRNAs. The distribution of layered H3K27ac marks, genome segmentation from ENCODE, histone modifications, nucleosome position, and CpG methylation inside a region of chr1 are shown as in the UCSC Browser. Sequences of srRNAs are shown at the bottom.

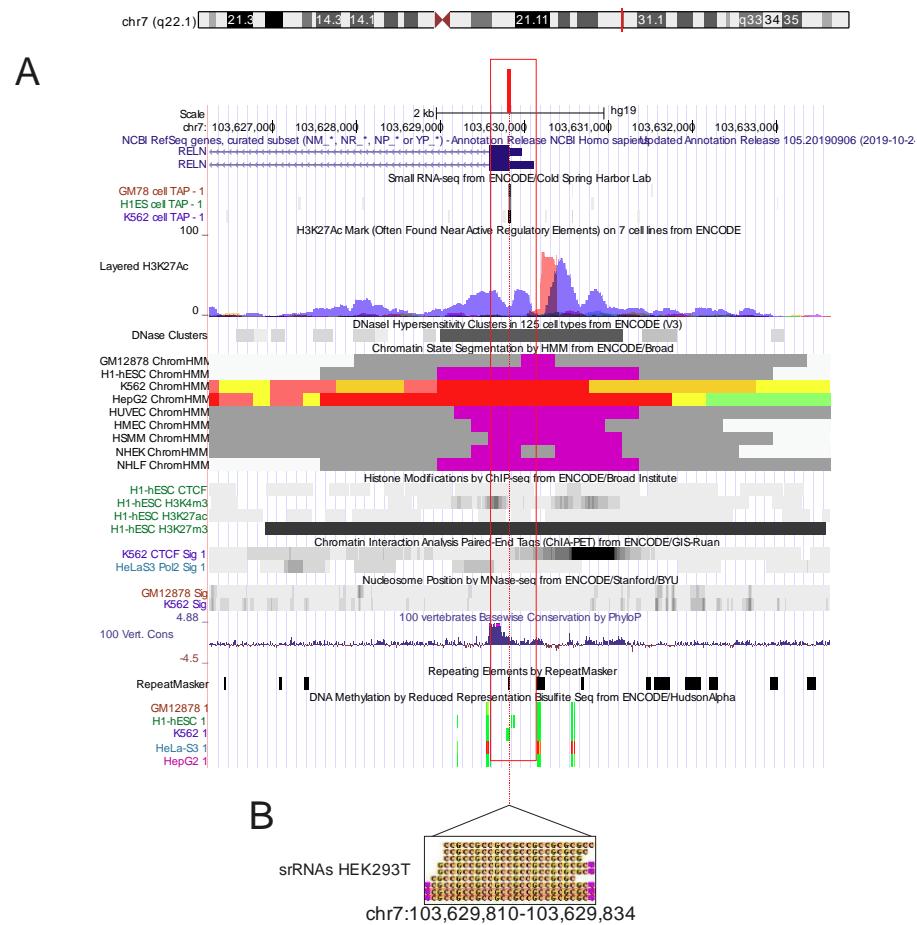

Figure S6. Characterization of the srRNA targets inside of the *RELN* gene. The red bar at the top shows the region corresponding to srRNAs. (A) The distribution of layered H3K27ac marks, genome segmentation from ENCODE, histone modifications, nucleosome position, and CpG methylation inside a region of chr1 are shown as in the UCSC Browser. (B) Sequences of srRNAs are shown at the bottom.

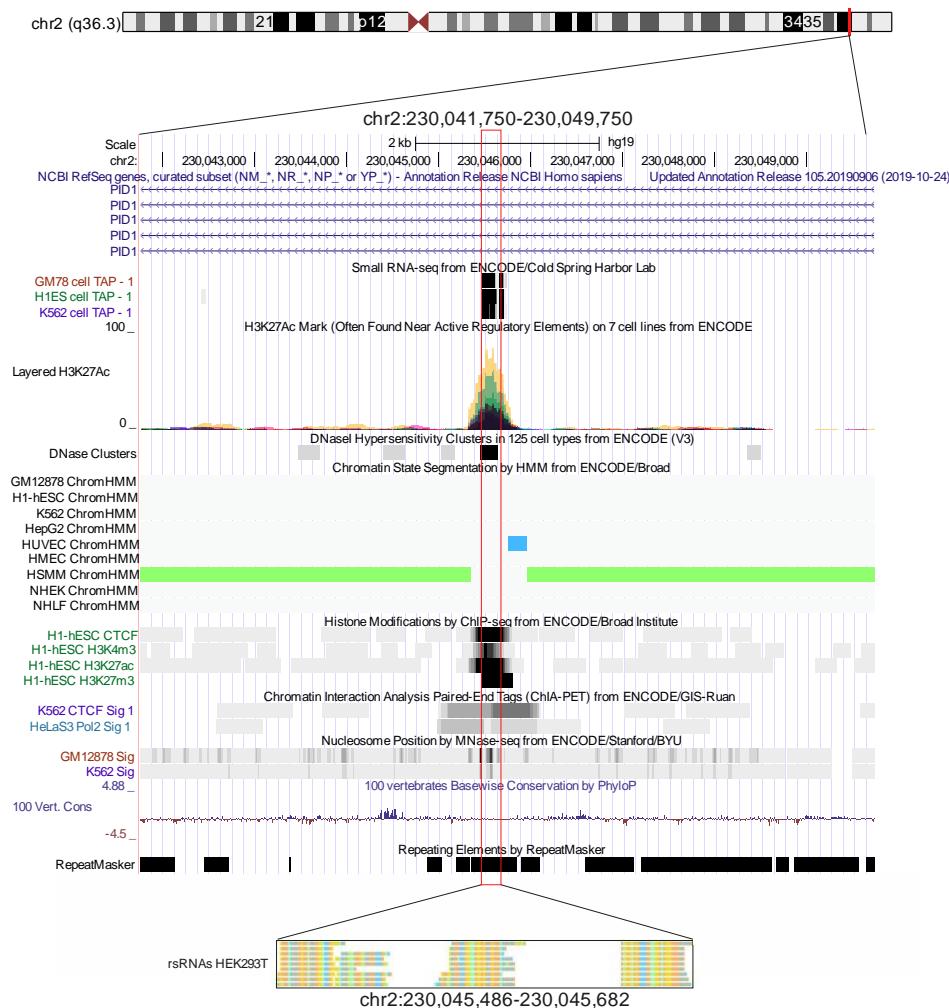

Figure S7. Characterization of the srRNA targets inside the intron of the *PID1* gene. The red frame shows the region corresponding to srRNAs. The distribution of layered H3K27ac marks, genome segmentation from ENCODE, histone modifications, nucleosome position, and CpG methylation inside a region of chr1 are shown as in the UCSC Browser. Sequences of srRNAs are shown at the bottom.

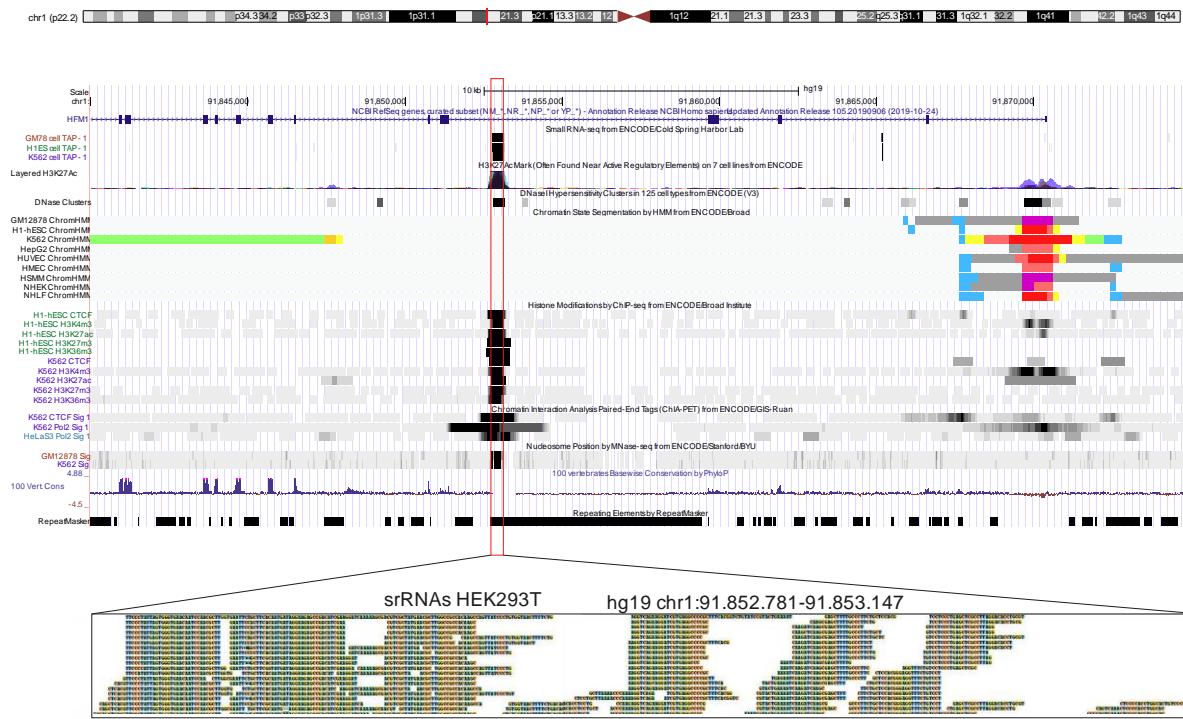

Figure S8. Characterization of the srRNA targets inside the intron of the *HFM1* gene. The red frame shows the region corresponding to srRNAs. The distribution of layered H3K27ac marks, genome segmentation from ENCODE, histone modifications, nucleosome position, and CpG methylation inside a region of chr1 are shown as in the UCSC Browser. Sequences of srRNAs are shown at the bottom.

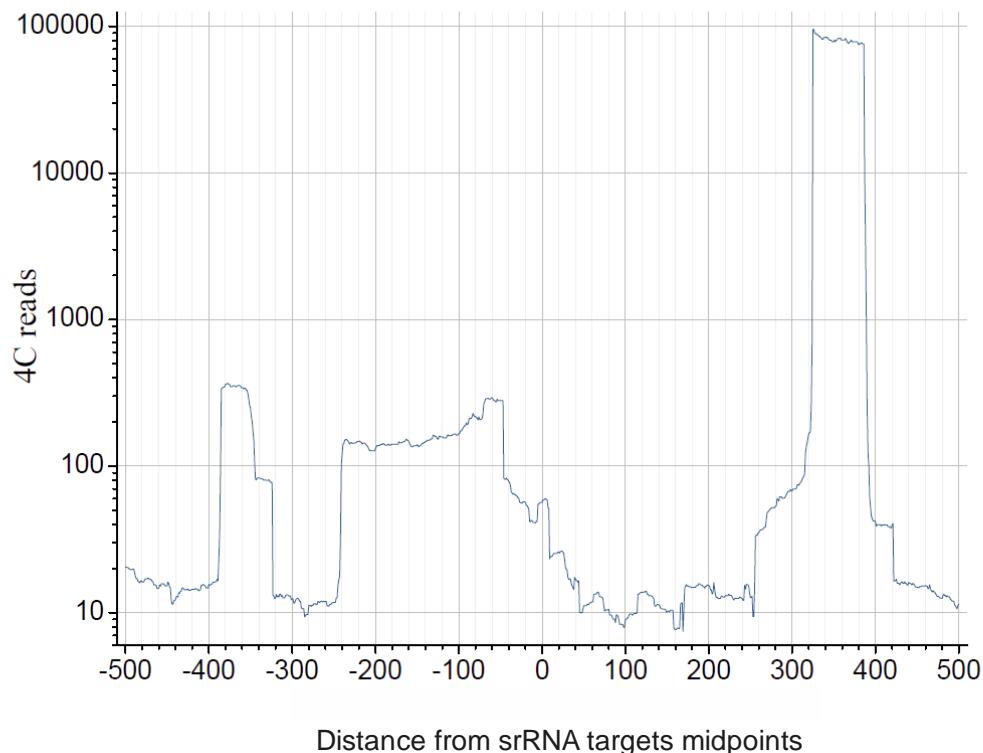

Figure S9. Profile of 4C-rDNA contacts around srRNA targets in the hg38 genome. The number of mapped rDNA contacts (log10 scale) are shown around srRNA target midpoints.

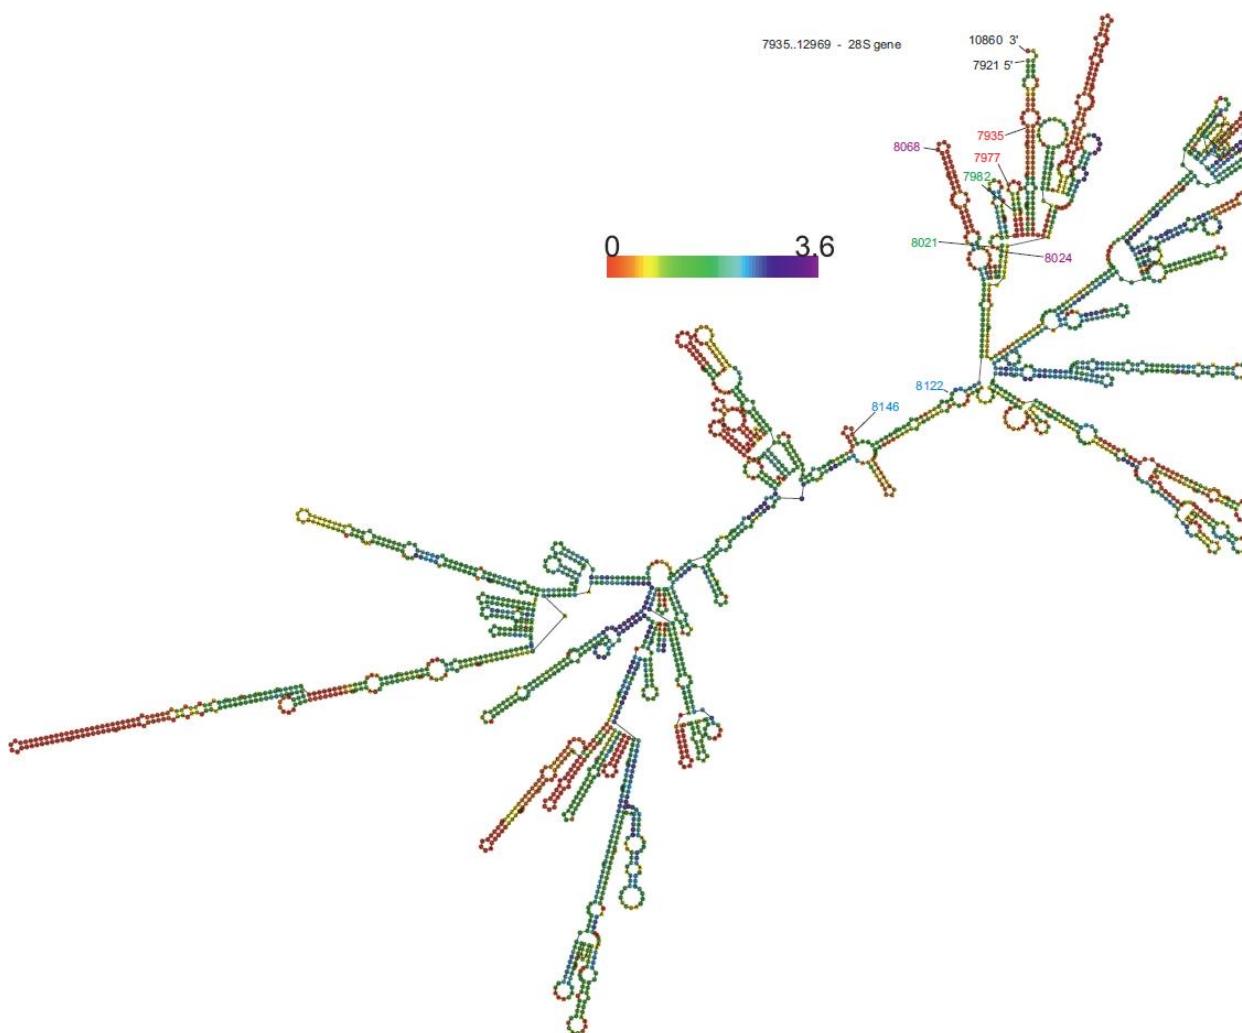

Figure S10. Example of the formation of stem-loop structures in the 28S rRNA fragment. The numbering in rDNA is according to the human ribosomal DNA complete repeating unit sequence (accession number: U13369). The most prominent srRNA is formed from the 5' end of the 28S gene with coordinates 7935–7977 (shown in red; see Fig. 2B). Other stem-loop structures shown in Fig. 2B with coordinates 8024–8068, 7982–8021, and 8122–8146 are shown by the values in violet, green, and blue, respectively. The search of RNA secondary structures was performed using the RNAfold Web server (<http://rna.tbi.univie.ac.at>).

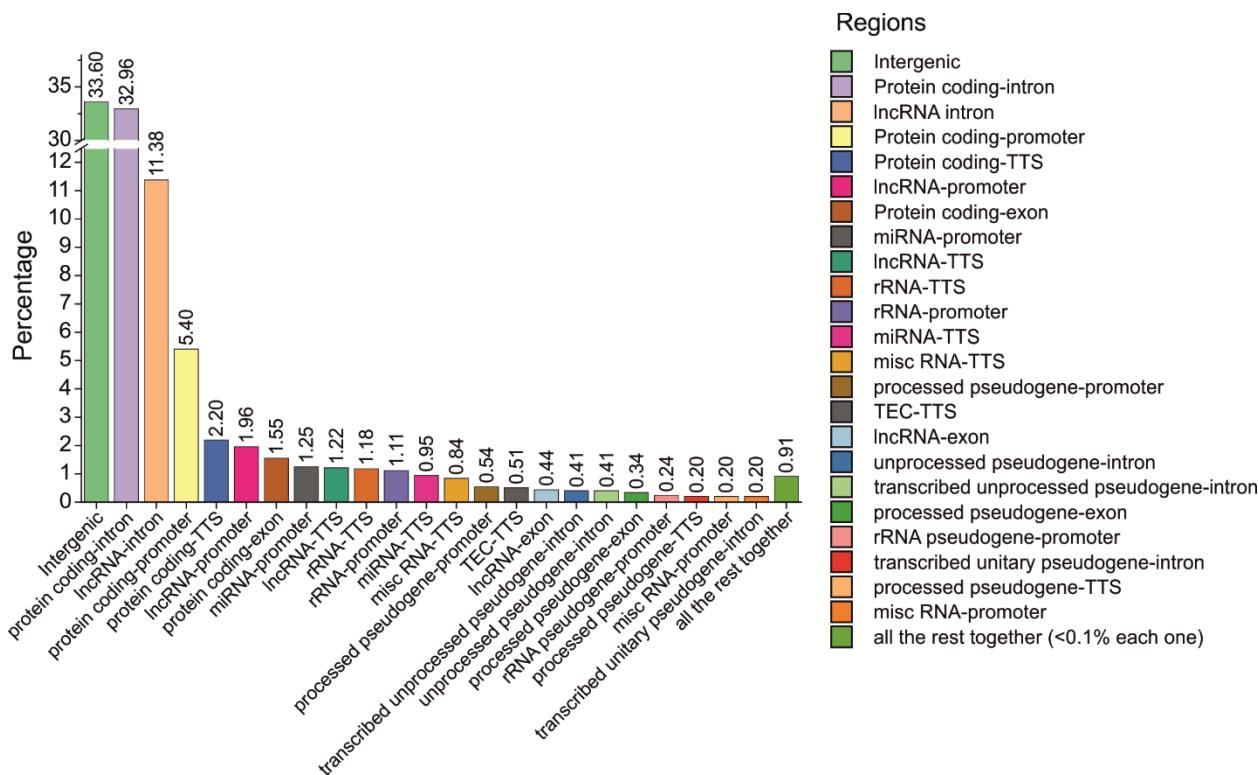

Figure S11. Distribution of srRNA target sites in different portions of the human genome. The values in the labels present a percentage of the corresponding portion. srRNA mappings were annotated to the genome by `annotatePeaks.pl` tool from Homer software package. EMBL annotation hg38 v.97 was obtained from Ensembl-EBI FTP server (ftp://ftp.ensembl.org/pub/release-97/gtf/homo_sapiens/Homo_sapiens.GRCh38.97.chr.gtf.gz).

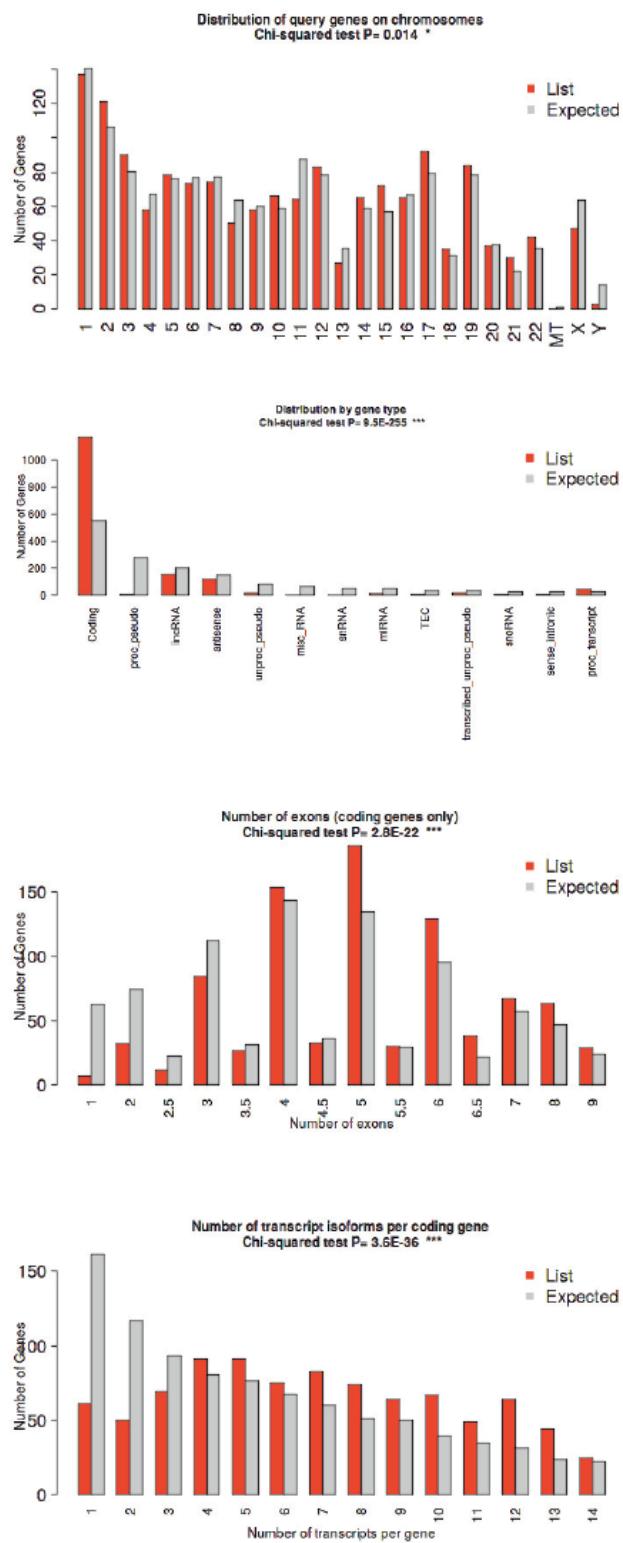

Figure S12. The distribution of srRNA targets in human chromosomes. The search was performed using the <http://bioinformatics.sdsstate.edu/go/> resource. All chromosomes possess the targets.

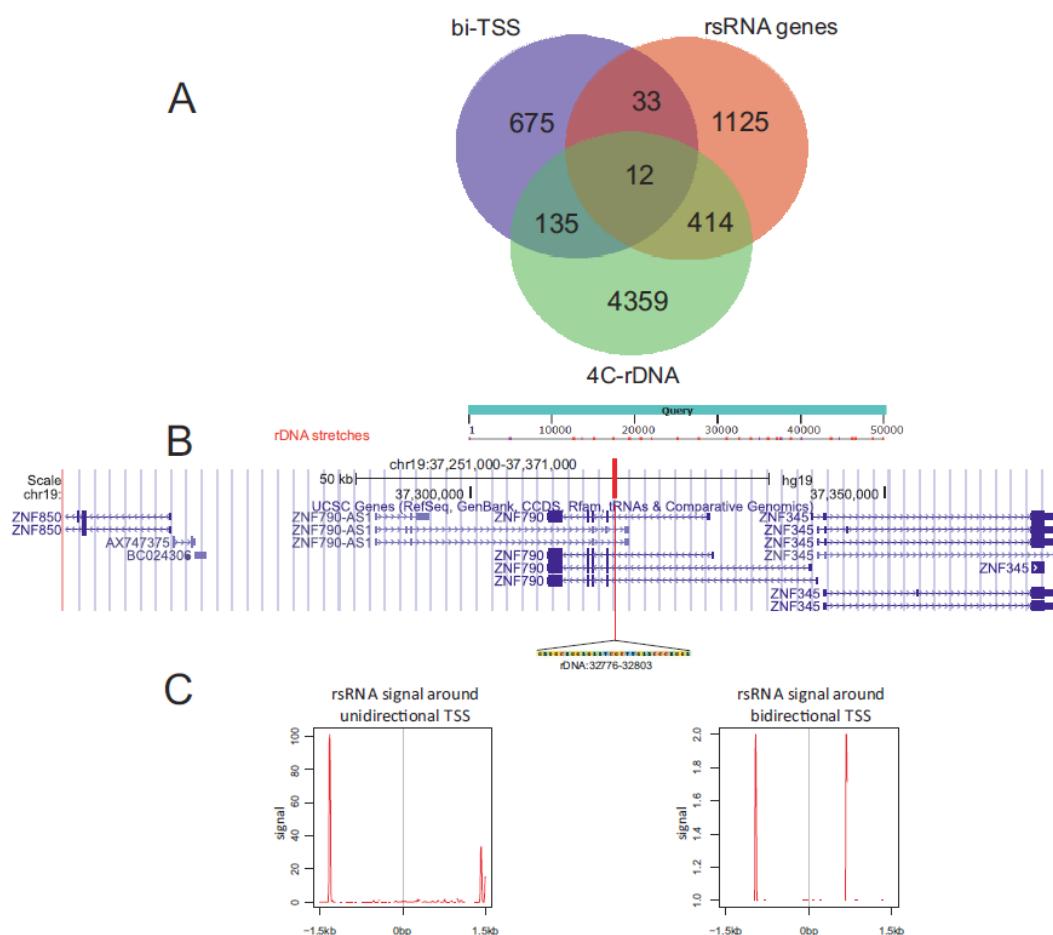

Figure S13. The srRNA targets at bidirectional TSS. (A) A Venn diagram shows the intersections between srRNA genes, rDNA-contacting genes, and bidirectional TSS. (B) A region from chr19 containing a bidirectional promoter that is shaped by ZNF790 and ZNF790-AS genes is shown. At the top, the diverged and rearranged rDNA stretches are presented. At the bottom, srRNA from the IGS region of the rDNA gene is indicated. (C) Whole-genome profiles of unique srRNAs around unidirectional or bidirectional promoters in HEK293T cells. The RefSeq database at NCBI was used for the analysis.

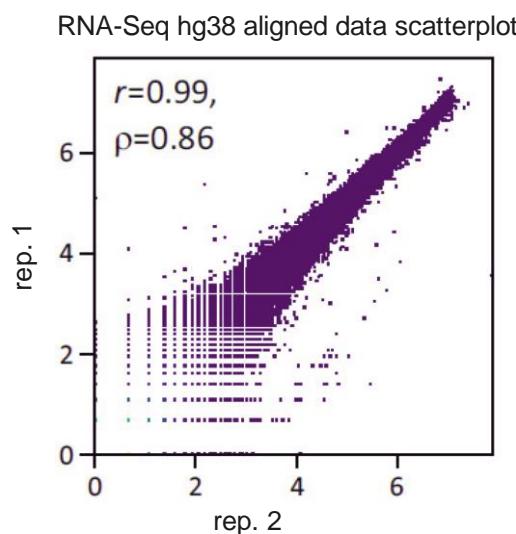

Figure S14. The consistency of RNA-Seq data. Scatterplot shows the consistency between the RNA-Seq replicates for the HEK293T cells.

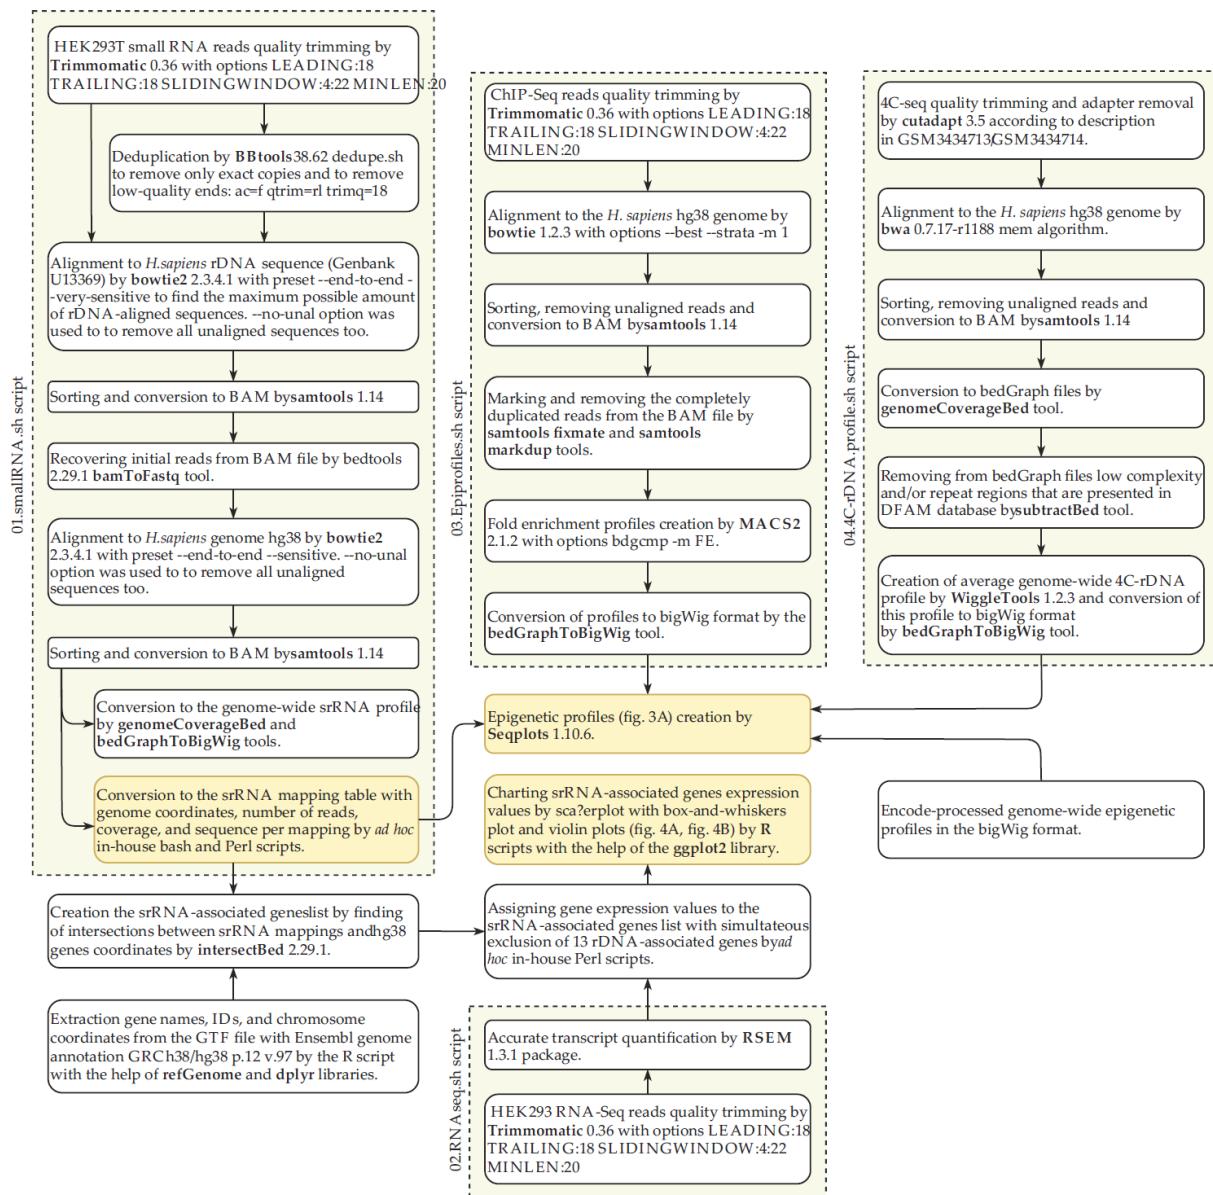

Figure S15. The bioinformatics pipeline illustrating the isolation of srRNAs and integration with downstream analysis. The details are described in the Materials and Methods. All scripts from this figure are deposited to the public Github repository: <https://github.com/lokapal/IJMS2022.srRNA>.

Tables S1–S6

Table S1. List of srRNA genes and the corresponding srRNA sequences. Excel file attached separately. Related to Fig. 1. The sequences corresponding to the interspersed repeats are shown in lower case. Column F shows the sequences of 19–50-nt srRNAs or the longer stretches where individual 19–50-nt srRNAs are aligned without gaps.

Table S2. GO associations with Biological Process (GO Profiler) of srRNA genes. Related to Fig. 1C.

Supplementary Text

Methylation at srRNA target sites

Encode ENCSR794HFF accession was used to obtain HEK293 methylation track: ENCFF001TMR and ENCFF001TMQ replicates were downloaded, and an intersection genome track was created by bedtools intersectBed tool.

Encode does not contain HEK293 or HEK293T methylation data mapped to the hg38 genome build and so we remapped all srRNA data to hg19 according to the protocol in the Methods section. The mapping produced 2758 mapping regions.

Next, we calculated the direct intersection between HEK293 methylation and srRNA genome tracks (whole-genome targets of srRNAs). The tracks intersected in 1545 regions or 56.02% of the srRNA genome track. We calculated the genome-wide correlations between these tracks by GenomeTrackAnalyzer¹ and StereoGene². The results of both programs ($z=2.447 p=0.0144$ for GenomeTrackAnalyzer and Mann-Z=2.908 $p=0.0037$ for StereoGene) imply that srRNA targets and methylation sites correlate significantly. Thus, we can conclude that the srRNAs targets are often methylated.
