Genome-wide association study reveals marker trait associations (MTA) for waterlogging-triggered adventitious roots and aerenchyma formation in barley

S M Nuruzzaman Manik, Md Quamruzzaman, Chenchen Zhao, Peter Johnson, Ian Hunt, Sergey Shabala, Meixue Zhou*

Supplementary tables

Table S1: List of the varieties with waterlogging tolerance

a) Tolerant line with large amount of AR and a higher proportion of RCA formation	b) Tolerant lines with a high number of AR but poor ability for RCA formation	c) Intolerant lines with a less number of AR and a high proportion of RCA	d) Intolerant lines with limited AR and limited proportion of RCA formation

-------------------------	--	--	--------------------------

Here, genotypes are showing alphabetically in each group. Based on the combination of adventitious root development and aerenchyma formation, genotypes are clustered into four groups: (a) tolerant lines with a large amount of AR and a high proportion of RCA formation (both scores close to 1), (b) tolerant lines with a high number of AR but poor ability for RCA formation, c) intolerant lines with a less number of AR and a high proportion of RCA and (d) intolerant lines with limited AR and limited proportion of RCA (both scores approaching 10).

Table S2: Significant SNPs from the traits adventitious root formation and aerenchyma formation under waterlogging conditions. Output is from the Farm CPU model within rMVP.

SNPs	Chr	Pos	Effect	SE	<i>p-value</i>	MTA	Traits
3663961	1	501,154,892	-1.58	0.35	7.95E-07	MTA.WL.RCA.1H	Aerenchyma

Table S4: T-test results for allele effects of tolerant allele (“T”) versus susceptible allele (“S”) from adventitious root development and aerenchyma formation. The data are for the top two SNPs (i.e. the most extreme p-values from the Farm CPU analysis) for adventitious root development and aerenchyma formation, respectively. The “SNP combo” data is from varieties which have either both respective tolerant alleles, or both respective sensitive alleles. The tests are simple t-tests for a difference in means (so the p-values differ from the more complex Farm CPU model). The base data for the tests is displayed in Figure 5.

Adventitious root t-test results for differences between T and S (‘T minus S’)

	SNP 3268328	SNP 3271458	SNP combo
Mean of tolerant (T)	5.03	4.86	4.43
Mean of susceptible (S)	5.75	5.62	5.80
Difference in means	-0.72	-0.76	-1.38
95% confidence interval for difference	(-0.97,-0.46)	(-1.11,-0.41)	(-1.86,-0.89)
Degrees of freedom	694	694	467
-log₁₀ p-value	7.23	4.63	7.46

Aerenchyma t-test results for differences between T and S (‘T minus S’)

	SNP 3913494	SNP 3433774	SNP combo
Mean of tolerant (T)	4.59	5.25	4.15
Mean of susceptible (S)	6.14	6.38	6.44
Difference in means	-1.55	-1.13	-2.30
95% confidence interval for difference	(-2.09,-1.01)	(-1.46,-0.79)	(-2.94,-1.65)
Degrees of freedom	691	691	466
-log₁₀ p-value	7.64	10.12	11.15
