**Figure S1.** Effect of temperature (a), methanol concentration (b), pH of the medium (c) and induction time (d) on enzyme activity of *TtGH74* and expression levels shown on the gels.

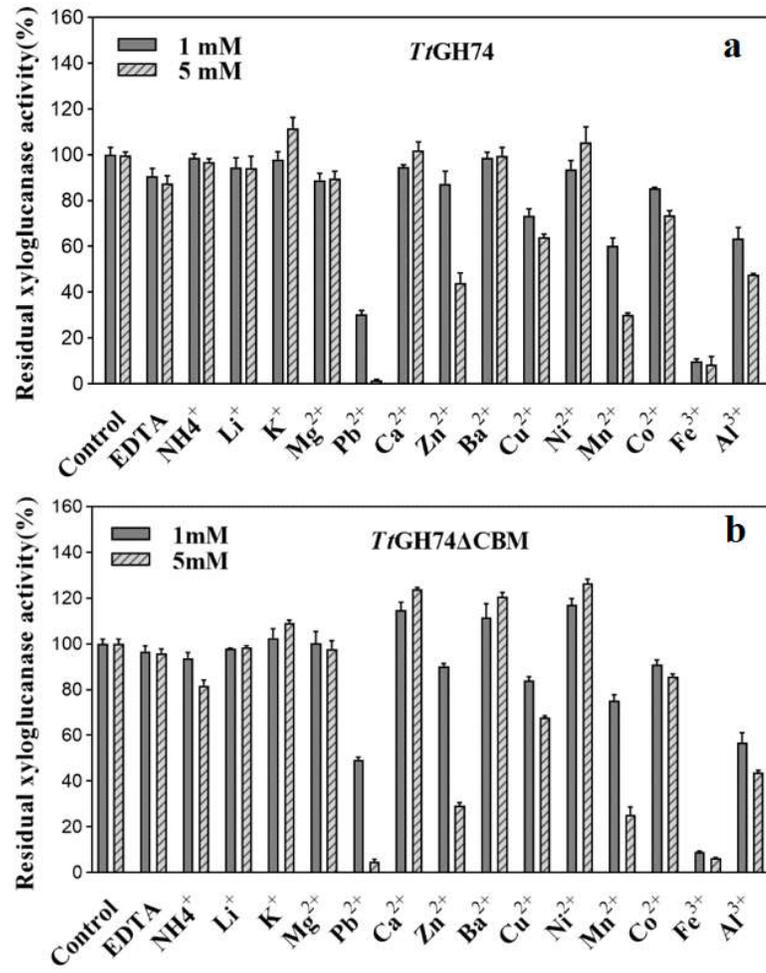

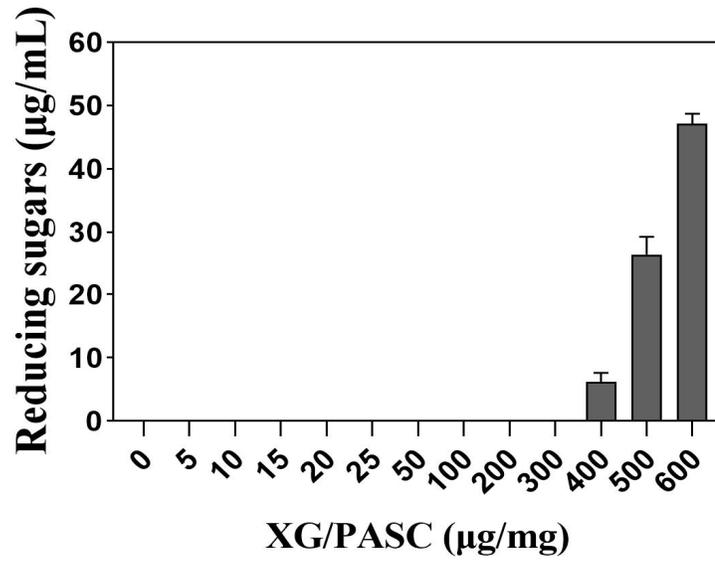

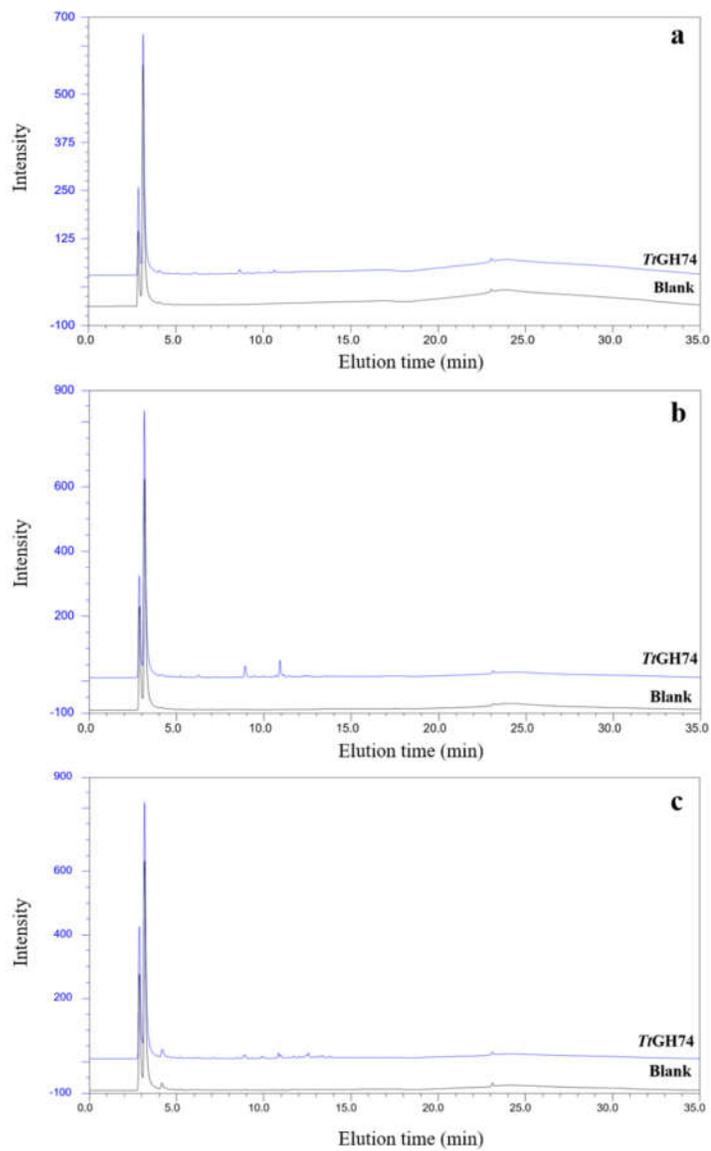

Figure S2. Effect of metals ions (1 and 5 mM) on the *TiGH74* (a) and *TiGH74ΔCBM* (b) activity.

**Figure S3.** Multiple sequence alignments between *TcGH74* and *GH74* xylotriose isomerases from other fungal strains (*Trichoderma reesei* GH74 XP\_006966240.1; *Coniochaeta ligniaria* GH74 OIW24422.1; *Coniochaeta sp.* GH74 KAB5566692.1; *Trichoderma parareesei* GH74 OTA06671.1; *Neurospora crassa* GH74 XP\_958569.1). Conserved tryptophan residues were indicated by the yellow boxes.

**Figure S4.** The reducing sugars released from the free XG in supernatant of XG-coated PASC mixture by extensively hydrolysis of overdose *TiGH74*. The reducing sugar was measured by the DNS method.

**Figure S5.** HPAEC-PAD analysis of reaction products generated by *TtGH74* from alkali treated residues of sulfuric acid pretreated-corn bran (a), DES pretreated-corn bran (b) and DES pretreated-apple pomace (c). The blank in the HPAEC-PAD represents a control experiment without *TtGH74*.
