| The dependence of the viscosity of radical-reactive compositions on the shear rate for a constant temperature of 25℃. |
| --- |

Figure S1. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 1% wt. ZnO on shear rate for a constant temperature of 25°C.
Figure S2. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 5% wt. ZnO on shear rate for a constant temperature of 25°C.
Figure S3. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 1% wt. AlZnO on shear rate for a constant temperature of 25°C.

Figure S4. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 5% wt. AlZnO on shear rate for a constant temperature of 25°C.

Figure S5. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 0,1% wt. TiO$_2$ on shear rate for a constant temperature of 25°C.

Figure S6. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 0,5% wt. TiO$_2$ on shear rate for a constant temperature of 25°C.

Figure S7. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 1% wt. Kaolin nanoclay on shear rate for a constant temperature of 25°C.

Figure S8. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 5% wt. Kaolin nanoclay on shear rate for a constant temperature of 25°C.
Figure S9. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 1% wt. ZrO$_2$ on shear rate for a constant temperature of 25°C.

Figure S10. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 5% wt. ZrO$_2$ on shear rate for a constant temperature of 25°C.

Figure S11. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 1% wt. Al$_2$O$_3$ on shear rate for a constant temperature of 25°C.

Figure S12. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 5% wt. Al$_2$O$_3$ on shear rate for a constant temperature of 25°C.

Figure S13. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 1% wt. SiO$_2$ on shear rate for a constant temperature of 25°C.

Figure S14. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 5% wt. SiO$_2$ on shear rate for a constant temperature of 25°C.
Figure S15. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 10% wt. TiO$_2$ on shear rate for a constant temperature of 25°C.

Figure S16. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 50% wt. TiO$_2$ on shear rate for a constant temperature of 25°C.

Figure S17. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 10% wt. Kaolin nanoclay on shear rate for a constant temperature of 25°C.

Figure S18. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 50% wt. Kaolin nanoclay on shear rate for a constant temperature of 25°C.

Figure S19. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 10% wt. ZrO$_2$ on shear rate for a constant temperature of 25°C.

Figure S20. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 50% wt. ZrO$_2$ on shear rate for a constant temperature of 25°C.
Figure S21. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 10% wt. Al_2O_3 on shear rate for a constant temperature of 25°C.

Figure S22. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 50% wt. Al_2O_3 on shear rate for a constant temperature of 25°C.

Figure S23. Dependence of viscosity, nanocomposition polymerizing by radical mechanism with 10% wt. SiO_2 on shear rate for a constant temperature of 25°C.

The dependence of the viscosity of cationic-reactive compositions on the shear rate for a constant temperature of 25℃.

Figure S24. Dependence of viscosity, nanocomposition polymerizing by cationic mechanism with 1% wt. ZnO on shear rate for a constant temperature of 25°C.

Figure S25. Dependence of viscosity, nanocomposition polymerizing by cationic mechanism with 1% wt. AlZnO on shear rate for a constant temperature of 25°C.

Figure S26. Dependence of viscosity, nanocomposition polymerizing by cationic mechanism with 0,1% wt. TiO$_2$ on shear rate for a constant temperature of 25°C.

Figure S27. Dependence of viscosity, nanocomposition polymerizing by cationic mechanism with 1% wt. Kaolin nanoclay on shear rate for a constant temperature of 25°C.

Conversion rates of the photopolymerization process carried out for layers of 25 μm radical-reactive compositions containing different weight concentrations of nano-additives.

Figure S28. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. ZnO for a radical reacting system and a layer thickness of 25 μm.

Figure S29. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. AlZnO for a radical reacting system and a layer thickness of 25 μm.

Figure S30. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. Kaolin nanoclay for a radical reacting system and a layer thickness of 25 μm.

Figure S31. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. TiO2 for a radical reacting system and a layer thickness of 25 μm.

Figure S32. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. ZrO2 for a radical reacting system and a layer thickness of 25 μm.

Figure S33. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. Al2O3 for a radical reacting system and a layer thickness of 25 μm.

Conversion rates of the photopolymerization process carried out for layers of 1,4 mm radical-reactive compositions containing different weight concentrations of nano-additives.

Figure S34. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. ZnO for a radical reacting system and a layer thickness of 1,4 mm.

Figure S35. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. AlZnO for a radical reacting system and a layer thickness of 1,4 mm.

Figure S36. Kinetic profiles for compositions consisting of 0,1% wt. and 0,5% wt. TiO_2 for a radical reacting system and a layer thickness of 1,4 mm.

Figure S37. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. Kaolin nanoclay for a radical reacting system and a layer thickness of 1,4 mm.

Figure S38. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. ZrO_2 for a radical reacting system and a layer thickness of 1,4 mm.

Figure S39. Kinetic profiles for compositions consisting of 1% wt. and 5% wt. Al_2O_3 for a radical reacting system and a layer thickness of 1,4 mm.

Changes in FT-IR spectra showing band decay at 1634 cm⁻¹ wavenumber monitored for a radical polymerizing composition for a test layer thickness of 25 μm.

Figure S40. FT-IR spectra recorded before and after photopolymerization of nanocomposition polymerizing according to radical mechanism with 1% wt. ZnO for a 25 μm thick layer of the sample.

Figure S41. FT-IR spectra recorded before and after photopolymerization of nanocomposition polymerizing according to radical mechanism with 5% wt. ZnO for a 25 μm thick layer of the sample.
