**Supplementary Method S1.** Liver total cholesterol and triglyceride content analysis.

- 1). Sample preparation: 0.1 g liver tissues were weighed accurately with an analytical balance, add 9 times volume of normal saline, ground at 60 Hz for 1 min at 4°C to prepare 10% homogenate, centrifuged at 3000 r/min and 4°C for 10 min, and the supernatant was aspirated for testing.
- 2) Determination of protein content. The concentration of total protein in each set of samples was tested according to the BCA kit instructions. The procedure is as follows.

	Blank well	Standard well	Assay well
Double distilled water (μL)	10	-	-
563 μg/mL Standard (μL)	-	10	-
Samples to be tested (μL)	-	-	10
Working solution (μL)	250	250	250

Mix well, incubate at 37°C for 30 minutes at 562 nm, and measure the absorbance of each well by microplate reader.

Microplate reader colorimetric calculation formula: Total protein concentration (μg/mL) = (measured OD value - blank OD value) / (standard OD value - blank OD value) \* calibrator concentration (524 μg/mL) \* dilution factor before sample test

- 3) Determination of total cholesterol. According to the TC kit instructions, the content of cholesterol in mouse liver tissue was detected. The operation steps are as follows:

	Blank well	Standard well	Assay well
Double distilled water (μL)	2.5	-	-
Standard (μL)	-	2.5	-
Samples to be tested (μL)	-	-	2.5
Working solution (μL)	250	250	250

Mix well, incubate at 37°C for 10 minutes at 510 nm, and measure the absorbance of each well by microplate reader.

Microplate reader colorimetric calculation formula: Total cholesterol content (mmol/gprot) = (sample OD value - blank OD value) / (standard OD value - blank OD value) \* calibrator

concentration (mmol/L) / protein concentration of sample to be tested (gprot/L)

4) Triglyceride determination. According to the instructions of TG kit, the content of triglyceride in liver tissue of mice was detected. The operation steps are as follows:

	<b>Blank well</b>	<b>Standard well</b>	<b>Assay well</b>
Double distilled water ( $\mu$ L)	2.5	-	-
Standard ( $\mu$ L)	-	2.5	-
Samples to be tested ( $\mu$ L)	-	-	2.5
Working solution ( $\mu$ L)	250	250	250

Mix well, incubate at 37°C for 10 minutes at 510 nm, and measure the absorbance of each well by microplate reader.

Microplate reader colorimetric calculation formula: Triglyceride content (mmol/gprot) = (sample OD value - blank OD value) / (standard OD value - blank OD value) \* calibrator concentration (mmol/L) / protein concentration of the sample to be tested (gprot/L)

5) Accuracy:

- a. the absorbance of the reagent blank tube was  $\leq 0.100$ .
- b. linearity:  $r^2 > 0.995$  in the range of 0 to 19.39 mmol/L.
- c. precision: CV  $\leq 3\%$  and inter-assay relative range  $\leq 5\%$ .

6) Each set of 15 replicates was tested three times, and the trends of the analysis results were consistent for the three times.
