**Figure S1. TFBSS within the -1650~1485 and -1350~1250 segments of human *ENDOU-1* gene, as predicted using TFsitescan.**

**A**

**B**

**Figure S2. Scheme of plasmid construction.** (A) Two-step PCR strategy to generate plasmids harboring various internal deletions within the pE2.1p construct. For example, pE2.1p lacking -1485~1350 (pE2.1p-d1485/1350). Plasmids pE2.1p-d1850/1750 and pE2.1p-d1749/1650 were generated using the same strategy except of using restriction enzymes KpnI and Xhol and corresponding primers (Table 1). Similarly, pE2.1p-d1350/1250 was generated using Xhol and StuI and corresponding primers. (B) Restriction and ligation strategy to generate plasmid pE2.1p-d1649/1486. A 0.5 kb PCR product containing an internal MscI cutting site was amplified using primers F5 and R5, followed by insertion into KpnI and MscI-digested plasmid pE2.1p.
