Supplementary Information for

SABRE hyperpolarization with up to 200 bar parahydrogen in standard and quickly removable solvents

Table of contents

Figure S1: Hydride signals of hyperpolarized solutions with 17.5 mmol L⁻¹ pyrazine at different pressures.

Figure S2: Integrals of hydride signals with increasing pressure. The dotted lines serve as a visual guide.

Figure S3: Photo-collage showing the solid catalyst-pyrazine sample before applying *p*-H₂/CO₂ (left and middle) and the recrystallized sample after removing the gas (right).

Figure S4: Photo-collage showing the liquefied catalyst-pyrazine sample after applying gas pressure. The top left and bottom photos show the sample pressurized at 200 bar with only CO₂ to acquire the spectrum at thermal polarization. The upper right photo shows the activated catalyst under *p*-H₂/CO₂.

Figure S5: Hydride signals of hyperpolarized pyrazine solutions with two solvents: *d*-methanol (green) and in liquefied CO₂ (blue).

Figure S1: Hydride signals of hyperpolarized solutions with 17.5 mmol L⁻¹ pyrazine at different pressures.

Figure S2: Integrals of hydride signals with increasing the pressure. The dotted lines serve as a visual guide.

Figure S3: Photo-collage showing the solid catalyst-pyrazine sample before applying $p\text{-H}_2/\text{CO}_2$ (left and middle) and the recrystallized sample after removing the gas (right).

Figure S4: Photo-collage showing the liquefied catalyst-pyrazine sample after applying gas pressure. The top left and bottom photos show the sample pressurized at 200 bar with only CO₂ to acquire the spectrum at thermal polarization. The upper right photo shows the activated catalyst under *p*-H₂/CO₂.
