

Supplementary Table S1. Characteristics of classic diagnostic methods of pancreatic ductal adenocarcinoma. [1]

Diagnostic tool	Advantages	Disadvantages
Transabdominal ultrasound	<ul style="list-style-type: none"> • non-invasive • relatively cost-effective 	<ul style="list-style-type: none"> • difficulties in imaging of pancreatic body and tail cancers • highly dependent on the operator's experience
Computed tomography	<ul style="list-style-type: none"> • non-invasive • good spatial resolution • good temporal resolution • wide anatomic coverage • best performance for the evaluation of vascular involvement 	<ul style="list-style-type: none"> • may not depict small metastases to the liver or peritoneum
EUS-guided fine-needle aspiration	<ul style="list-style-type: none"> • high-resolution images of the pancreas • ability to obtain specimens for histopathological diagnosis 	<ul style="list-style-type: none"> • an invasive procedure, however considered safe and accurate
Magnetic resonance imaging	<ul style="list-style-type: none"> • non-invasive • greater soft-tissue contrast of MRI compared with that of CT 	<ul style="list-style-type: none"> • worse spatial resolution compared to CT (requires relatively more time to perform the imaging)

Supplementary Table S2. Diagnostic performance of circulating miRNA (CS – clinical stage, PC-pancreatic cancer, CP-chronic pancreatitis, IPMN – intraductal papillary mucinous neoplasm AUC – area under the curve), 95% CI are provided in square brackets.

*-analysis with Abcam Fireplex™ platform
