

Supplementary Material

This is the supplementary material associated to the following scientific article:

Chaves, Ó.M.; Morales-Cerdas, V.; Calderón, J.; Azofeifa-Rojas, I.; Riba-Hernández, P.; Solano-Rojas, D.; Chaves, C.; Chacón-Madrigal, E.; Melin, A.D. Plant diversity in diet of Costa Rican Primates in contrasting habitats: a meta-analysis. *Diversity* **2023**

Supplemental Data:

Collection Methods Used in Unpublished Studies

Chaves et al. (44) collected data on the diet of three habituated *Alouatta palliata* groups during a 16-month period (Jun 2021-Sept 2022), that included the study period of this meta-analysis (Table 1). In this investigation, ÓMC, VMC, and JC followed the groups 1-2/days per month from dawn to dusk. The behavioral records were collected with the aid of high-definition binoculars (Nikon® Prostaff 5, 10 x 52) via instantaneous scans every 15 min during a 5 min period and, during the inter-scan period, 5-min focal animal samples were collected when some individual was feeding. Riba-Hernández & Stoner [52] and Stoner & Riba-Hernández [55] used the same field methods described in Stoner [56], i.e. 2-min focal animal observations, to study the foraging behavior of three free-ranging groups of *A. palliata*. Finally, in the forest fragment of the Danta Corcovado Lodge, Guadalupe, Península de Osa (N8.62103, W83.47594), Solano-Rojas [74] collected data on the diet of a habituated free-ranging group of *Saimiri o. oerstedii* during a 8-mo period (Dec 2018-July 2019) distributed in 62 sampling days.

The fieldwork in the investigation of Chaves et al. [44] was performed with the approval of the Comité Institucional de Cuidado y Uso de Animales of the Universidad de Costa Rica (Ethic authorization #CICUA-071-2021), the Comisión Institucional de Biodiversidad (authorization #CBio-4-2021), and the Sistema Nacional de Áreas de Conservación, SINAC (permission # ACT-OR-DR-110-2021).

Comparison of alpha-diversity of species in diet using the Shannon-Wiener index

Using a standardized number of study groups per primate species (i.e. 5 study groups), the plant species richness in diet was 217 species for *Ateles geoffroyi* (Shannon index, $H = 2.30$), 183 for *Saimiri*

oerstedii ($H = 2.23$), 145 for *Cebus imitator* ($H = 2.11$), and 66 species in *Alouatta palliata* ($H = 1.80$). Consequently, the Shannon indices differed significantly among primate species (see Table S1).

Table S1. Results of the Shannon-Wiener indexes comparison for the plant dietary diversity for Costa Rican non-human primates using a rarified random number of monkey groups (i.e. 5 groups/primate species).

Comparison ¹	Shannon-Wiener index ²	Hutcheson t-test	d.f.	P-value
<i>Ateles</i> vs <i>Alouatta</i>	2.30 vs 1.80	25.9	169	<0.0001
<i>Ateles</i> vs <i>Cebus</i>	2.30 vs 2.11	10.0	418	<0.0001
<i>Ateles</i> vs <i>Saimiri</i>	2.30 vs 2.23	4.1	472	<0.0001
<i>Saimiri</i> vs <i>Alouatta</i>	2.23 vs 1.80	21.7	181	<0.0001
<i>Saimiri</i> vs <i>Cebus</i>	2.23 vs 2.11	6.1	412	<0.0001
<i>Cebus</i> vs <i>Alouatta</i>	2.11 vs 1.80	14.6	215	<0.0001

¹The species with higher plant diversity in diet is enhanced in bold.

²The Shannon diversity index for each primate species is indicated

Table S3. Shared and non-shared plant species in the diet of the four Costa Rican non-human primates in Tropical Dry Forests and Rainy Forests. For this analysis we only considered the studies ≥ 6 months in duration. *Ap* = *Alouatta palliata palliata*, *Ag* = *Ateles geoffroyi*, *Ci* = *Cebus imitator*, *So* = *Saimiri oerstedii*. The data are based in a standardized sample of 4 monkey groups in Tropical Dry Forests and 3 groups in Rainy Forests. **S. oerstedii* do not occurs in Tropical Dry Forest.
