## Supplementary Materials: Direct Electrochemical Detection of Bisphenol A Using a Highly Conductive Graphite Nanoparticle Film Electrode

Xinwei Dong, Xiaoli Qi, Na Liu, Yuesuo Yang and Yunxian Piao

**Figure S1.** (**A**,**B**) TEM images of the GNs. The GNs are spherical carbon nanoparticles with a diameter of around 5 nm.

Figure S2. SEM images of (A) the GN film electrode and (B) the pristine GCE.

**Figure S3.** (**A**) Cyclic voltammetric responses of GN film electrode in BPA (10  $\mu$ M) solution at varying scan rates (10, 30, 50, 70, and 90 mV·s<sup>-1</sup>). (**B**) The plot of peak current versus scan rate. (**C**) The relationship between the peak potential and the natural logarithm of scan rate. The arrow represents scanning direction.

Figure S4. Electrochemical current responses of the GCE, the nafion-modified GCE electrode (GCE/nafion), and the GN film electrode in BPA solution (10  $\mu$ M) with 20 min pre-accumulation process.

Table S1. Comparison	with other	reports in	the li	terature of	f cases	using t	he direct	electroc	hemical
analysis method.
