Supplemental figure legends

Figure S1. Differential expression analyses. (A-C) P-value distributions. Plots show the raw p-value distribution among all genes for each differential expression analysis. The number of DEGs identified is shown (top margin; $P < 0.05$ with $FC > 1.25$ or $FC < 0.80$). (D-F) QQ plots for moderated T statistics. Deviation of sample quantiles (black points) from a straight line (null) reflects more differential expression among genes tested. (G) P-value empirical cumulative distribution functions (CDFs). CDF curves are shown for each comparison (to the CTL treatment). Deviation from a straight line indicates a non-uniform p-value distribution. (H-J) Number of DEGs identified at varying FC thresholds ($P < 0.05$; yellow arrow: $FC > 1.25$ or $FC < 0.80$). (K-M) Volcano plots. The -log₁₀-transformed p-value (vertical axis) is plotted with respect to the estimated FC (horizontal axis). (N-P) MA plots. The FC (vertical axis) is plotted against average expression (horizontal axis) for each gene. The solid green line is the LOESS curve fit. In (K) - (P), red and blue symbols correspond to genes significantly increased or decreased, respectively ($P < 0.05$, $FC > 1.25$ or $FC < 0.80$).

Figure S2. Motifs enriched in 5 kb sequences upstream of DEGs. (A) Z statistic interpretation. Z statistics were calculated using semiparametric generalized additive logistic models. Positive Z statistics indicate a relative increase in the frequency of a binding site in DEG upstream sequences (as compared to all non-DEGs). Negative Z statistics indicate a relative decrease in the frequency of a binding site in DEG upstream sequences (as compared to all non-DEGs). (B - G) Top motifs enriched in DEG upstream sequences. The primary and reverse complement sequence logos are shown for each motif along with the enrichment Z statistic (* $P < 0.05$; **FDR < 0.05).

Figure S3. NF-κB motif enrichment. (A) NF-κB motif sequence logos. (B, C) NF-κB motif enrichment. The Z statistic (vertical axis) quantifies enrichment of each motif in 5 kb upstream regions (positive value: motif enrichment; negative value: motif depletion; black asterisk: $P < 0.05$; red asterisk: FDR < 0.05). (D) NF-κB subunits. NF-κB signaling occurs through both canonical and non-canonical pathways. The canonical pathway is activated by stimuli such as TNF-α and IL-1 and leads to formation of p50/p65 dimers. The non-canonical pathway is triggered by stimuli such as lymphotoxin beta (LT-β) and B-cell activating factor (BAFF) to promote p52/RELB dimer formation. (E – I) NF-κB subunit gene expression. Average expression (log₂ scale) is shown for each treatment (± 1 standard error; * $P < 0.05$, comparison to CTL treatment). Expression is normalized to the average value in the CTL treatment for each gene.

Figure S4. Niacin-HCAR2 pathway genes. (A) *HCAR2*. (B) *PTGDS*. (C) *SREBF1*. (D) *ABCA1*. In (A) - (D), average expression (log₂ scale) is shown for each treatment (± 1 standard error; * $P < 0.05$, comparison to CTL treatment). Expression is normalized to the average value in the CTL treatment for each gene. (E) Niacin-activated genes. (F) Niacin-suppressed genes. In (E) and (F), the value of $|FC|_{max}$ was calculated for each gene, where $|FC|_{max}$ is defined as $\max[\text{abs}(FC_{MMP}, FC_{DRF}, FC_{IDMF})]$, and the 23 niacin-activated or niacin-suppressed genes with highest value of $|FC|_{max}$ are shown. Non-black gene labels are used if there is significant differential expression ($P < 0.05$) for any of the three comparisons, in which case the label color matches the comparison associated with the lowest differential expression p-value. (G, H, K, L,

O, P) FC estimates for niacin-activated genes. FC estimates are plotted and the proportion of fumarate-increased (red) fumarate-decreased (blue) genes is shown (P-value: Fisher's exact test). The percentage of increased/decreased genes is also indicated (see legend). (I, J, M, N, Q, R) The cumulative overlap is shown between niacin-activated genes and genes ranked based upon their response to each fumarate compound. A positive area statistic denotes enrichment among fumarate-increased genes, and a negative area statistic indicates enrichment among fumarate-decreased genes (P-value: Wilcoxon rank sum test).

Figure S5. Interferon regulatory factor (IRF) motif enrichment. (A) IRF motif sequence logos. (B, C) IRF motif enrichment. The Z statistic (vertical axis) quantifies enrichment of each motif in 5 kb upstream regions (positive value: motif enrichment; negative value: motif depletion; black asterisk: $P < 0.05$; red asterisk: FDR < 0.05). (D-F, H-J) IRF factor gene expression. Average expression (log₂ scale) is shown for each treatment (± 1 standard error; * $P < 0.05$, comparison to CTL treatment). Expression is normalized to the average value in the CTL treatment for each gene. (G) IRF1 predicted targets (motif #1 in part A). (K) IRF1 binding sites in regions upstream of IDMF-decreased genes. Motif sequence matches are shown at varying degrees of stringency (60-90%, see legend). The FC (IDMF/CTL) and differential expression p-value are shown (right margin).

Figure S6. Genes associated with A1/A2 reactive astrocyte polarization. (A) *C3*. (B) *GBP2*. (C) *S100A10*. (D) *TGFB1*. In (A) - (D), average expression (log₂ scale) is shown for each treatment (± 1 standard error; * $P < 0.05$, comparison to CTL treatment). Expression is normalized to the average value in the CTL treatment for each gene. (E, H, K) Median expression of genes associated with the A1 phenotype ($n = 161$ genes), A2 phenotype ($n = 75$), and pan-reactive astrogliosis (A1 + A2) ($n = 127$). Boxes outline FC estimates for the middle 50% of genes (middle line: median) and whiskers span the 10th to 90th percentiles. (F, G, I, J, L, M) Genes associated with A1 and A2 phenotypes. Figures show marker genes most strongly altered by (F, G) MMF, (I, J) DRF, or (L, M) IDMF. Genes shown in red and blue font are significantly up- and down-regulated by (F, G) MMF, (I, J) DRF, or (L, M) IDMF, respectively. (N, O, P) Gene ontology (GO) biological process (BP), molecular function (MF), and cell component (CC) terms associated with IDMF-decreased A1 astrocyte marker genes ($P < 0.05$). Enrichment is shown on the horizontal axis (-Log₁₀(p-value), conditional Fisher's Exact Test) and the number of genes associated with each term is given in parentheses (left margin). The single gene associated with each term and most strongly down-regulated by IDMF is listed within each figure.

Figure S7. Genes altered in MS patient astrocytes (GSE83670) and their overlap with DEGs. (A, E, I) Fold-change scatterplots. Plots compare FC estimates from the current analysis (horizontal axis) with those from MS astrocytes (vertical axis). Each point represents an individual gene. The proportion of genes within each quadrant is indicated in the top margin (red font: $P < 0.05$, Fisher's Exact Test). The yellow ellipse outlines the middle 90% of genes closest to the bivariate mean. (B, C, F, G, J, K) Venn diagrams. Diagrams show the overlap between genes altered by MMF, DRF or IDMF and those altered in astrocytes from MS patients ($P < 0.05$, FC > 1.25 or FC < 0.80). (D, H, L) GSEA analysis. Genes were ranked based upon expression change in MS astrocytes (horizontal axis) and cumulative overlap is shown (vertical axis) with respect to the top 100 genes increased (red) or decreased (blue) by each compound.

The area between each cumulative overlap curve and the diagonal is indicated (Area > 0: enrichment among MS-increased genes; Area < 0: enrichment among MS-decreased genes; p-value: two-sample Mann Whitney U test). (M, N) Genes altered in the same direction by IDMF ($P < 0.05$) and in astrocytes from MS patients ($P < 0.15$). (O, P) GO BP terms enriched among genes (O) increased by IDMF and in MS astrocytes or (P) decreased by IDMF and in MS astrocytes. The number of genes associated with each term is given in parentheses (left margin) and example genes for each term are listed within each figure.

Figure S8. *In vitro* kinetics of IDMF hydrolysis by carboxylesterase-2. (A) High-performance liquid chromatography (HPLC) chromatograms. Overlaid chromatograms are shown for IDMF and the metabolites MMF and IMMF. (B - D) Calibration curves. Calibration curves are shown for IDMF and its MMF and IMMF derivatives. The least-squares regression line is shown (dotted line) with associated R² value (top-left) and estimated regression equation (top margin). (E) IDMF degradation and product accumulation during hydrolysis. Estimated concentrations for each compound following hydrolysis are shown over two hours.

Figure S9. Microarray quality control. (A – L) Microarray pseudoimages. Darker colors correspond to regions of increased hybridization. (M) 260/280 absorbance ratios. (N) Eukaryotic hybridization controls. Controls were spiked into the hybridization cocktail at different relative concentrations (cre > BioD > BioC > BioB). The average expression of control probes is shown for each array. (O) Labeling controls. Poly-A RNA control probes target *B. subtilis* genes absent in eukaryotic samples, which were spiked into the RNA sample at varying concentrations during sample preparation (dap > thr > phe > lys). (P) Positive vs. negative AUC. Area under the curve (AUC) values were calculated from receiver operator curves (ROC), which were generated by evaluating how well probe set signals separate exons (positive control) from introns (negative control). A value of 1.00 is consistent with complete separation between exon- and intron-derived signals, whereas a value of 0.50 suggests overlap between these two probe set groups. (Q) Probe-level model (PLM) residuals. Boxplots outline the middle 50% of residual values for each array (whiskers: 10th to 90th percentiles). (R) Normalized unscaled standard error (NUSE) median. (S) NUSE interquartile range (IQR). (T) Relative log expression (RLE) median. (U) RLE IQR. (V) Hierarchical cluster analysis. Samples were clustered based upon the Euclidean distance with groups joined by average linkage. (W) Principal component (PC) analysis. Samples are plotted with respect to the first two PC axes. The percentage of variation accounted for by each PC axis is indicated in axis labels. (X) PC axis 1 standard score (Z-score). The p-value obtained from the univariate maximum normalized residual test for outliers is shown (i.e., Grubb's test).

Table S1. MMF-increased genes ($P < 0.05$ with $FC > 1.25$). The table lists 308 MMF-increased genes ranked by estimated fold-change (FC) (MMF/CTL). The gene symbol and description are shown. The raw p-value is listed in the final column (generalized least square linear models with moderated t-statistics; $n = 3$ samples per group).

Table S2. MMF-decreased genes (P < 0.05 with FC < 0.80). The table lists 142 MMF-decreased genes ranked by estimated fold-change (FC) (MMF/CTL). The gene symbol and description are shown. The raw p-value is listed in the final column (generalized least square linear models with moderated t-statistics; n = 3 samples per group).

Table S3. DRF-increased genes (P < 0.05 with FC > 1.25). The table lists 181 DRF-increased genes ranked by estimated fold-change (FC) (DRF/CTL). The gene symbol and description are shown. The raw p-value is listed in the final column (generalized least square linear models with moderated t-statistics; n = 3 samples per group).

Table S5. IDMF-increased genes (P < 0.05 with FC > 1.25). The table lists 673 IDMF-increased genes ranked by estimated fold-change (FC) (IDMF/CTL). The gene symbol and description are shown. The raw p-value is listed in the final column (generalized least square linear models with moderated t-statistics; n = 3 samples per group; *FDR < 0.10).

Table S6. IDMF-decreased genes (P < 0.05 with FC < 0.80). The table lists 903 IDMF-decreased genes ranked by estimated fold-change (FC) (IDMF/CTL). The gene symbol and description are shown. The raw p-value is listed in the final column (generalized least square linear models with moderated t-statistics; n = 3 samples per group; *FDR < 0.10).
