Table S1. Occurrence of ciguatoxins (CTXs) analogs in marine food webs. Only formal identifications of CTXs by chemical methods (i.e., liquid chromatography tandem mass spectrometry, LC-MS/MS) were considered.

Trophic stage	Pacific CTXs	Caribbean CTXs	Indian CTXs
Gambierdiscus	CTX3C, CTX3B, CTX4A, CTX4B, 2-hydroxyCTX3C, 51-hydroxyCTX3C, 54-deoxy-CTX1B, 52- <i>epi</i> -54-deoxy-CTX1B, M- <i>seco</i> -CTX3C, M- <i>seco</i> -CTX3Cmethyl acetal, M- <i>seco</i> -CTX4A/B, 2-OH-CTX3C, CTX3B/C isomers 2-3 [64,65,88,114-127]	ND*	ND
Fish	CTX1B, CTX1A, CTX4A, CTX4B, CTX4C, 52- <i>epi</i> -54-deoxyCTX1B, 54-deoxyCTX1B, 7-oxo-CTX1B, 7-hydroxyCTX1B, 4-hydroxy-7-oxoCTX1B, 54-deoxy-50-hydroxyCTX1B, 51-hydroxyCTX3C, 2,3-dihydro-2,3-dihydroxyCTX3C, 2,3-dihydro-51-hydroxy-2-oxoCTX3C, 2,3-dihydro-2,3,51-trihydroxy-CTX3C, A- <i>seco</i> -2,3-dihydro-51-hydroxyCTX3C, M- <i>seco</i> -CTX4A/4B, M- <i>seco</i> -CTX3C, CTX3C, CTX3B [17,18,32-34,50,51,69,86,88,110,114,117-119,121,127-134,136-146]	C-CTX1, C-CTX-2, C-CTX3, C-CTX4, C-CTX5-12** [2,3,36,52,53,56,87,111,135,147-159]	I-CTX-1-6** [160,161]
Marine invertebrates	CTX3C, CTX3B, CTX4A, CTX4B, 51-hydroxyCTX3C, CTX1B, M- <i>seco</i> -CTX3C, 54-deoxyCTX1B, 52- <i>epi</i> -54-deoxyCTX1B [18,88,95,162]	ND	ND
Sharks	ND	ND	I-CTX1-6** [163]

*ND : not documented. **Structure not elucidated.

Table S2. Relationship between biological or environmental factors and the CTX concentration or ciguatoxic status of fish samples. Only studies reporting statistical results based on a number of samples with $n \geq 20$ both by species (or families) and by factors were considered.

*The ciguatoxic status was established according to the neuroblastoma cell-based assay (CBA-N2a) results (see § 3.4). Of note, all these samples were also tested using the radioactive receptor binding assay (rRBA) (data not shown).

Table S4. Planned comparisons of ciguatoxicity levels in two-way (species × ciguatoxicity) permutational multivariate analysis of variance (PERMANOVAs) of size (fork length) and weight of five coral reef fish species (*Epinephelus polyphekadion*, *Scarus ghobban*, *Chlorurus microrhinos*, *Scarus forsteni*, *Naso lituratus*) and three levels of ciguatoxicity (negative, suspect, positive).

Response	Comparison	Factor	DF	Sum Sq	Mean Sq	Iter	p-value

No planned comparisons were made for age since this response variable showed no significant effects (see Table 1 in main text). Significance codes: $<0.001 ***$, $<0.01 **$, $<0.05 *$.

Table S5. Non-linear mixed-effects (NLME) estimates and 95% confidence intervals (CI) of von Bertalanffy growth coefficients in five coral reef fish species

Species	Fixed-effects	Lower 95% CI*	Estimate	Upper 95% CI
<i>Chlorurus microrhinos</i>	L ∞	57.9	60.3	62.7
<i>Scarus forsteni</i>	L ∞	47.5	53.5	59.6
<i>Scarus ghobban</i>	L ∞	37.1	42.5	47.8
<i>Naso lituratus</i>	L ∞	30.6	32.5	34.5
<i>Epinephelus polyphekadion</i>	L ∞	49.7	52.3	54.8
<hr/>				
<i>Chlorurus microrhinos</i>	K	0.174	0.191	0.207
<i>Scarus forsteni</i>	K	0.157	0.198	0.239
<i>Scarus ghobban</i>	K	0.179	0.223	0.267
<i>Naso lituratus</i>	K	0.321	0.342	0.363
<i>Epinephelus polyphekadion</i>	K	0.170	0.191	0.212

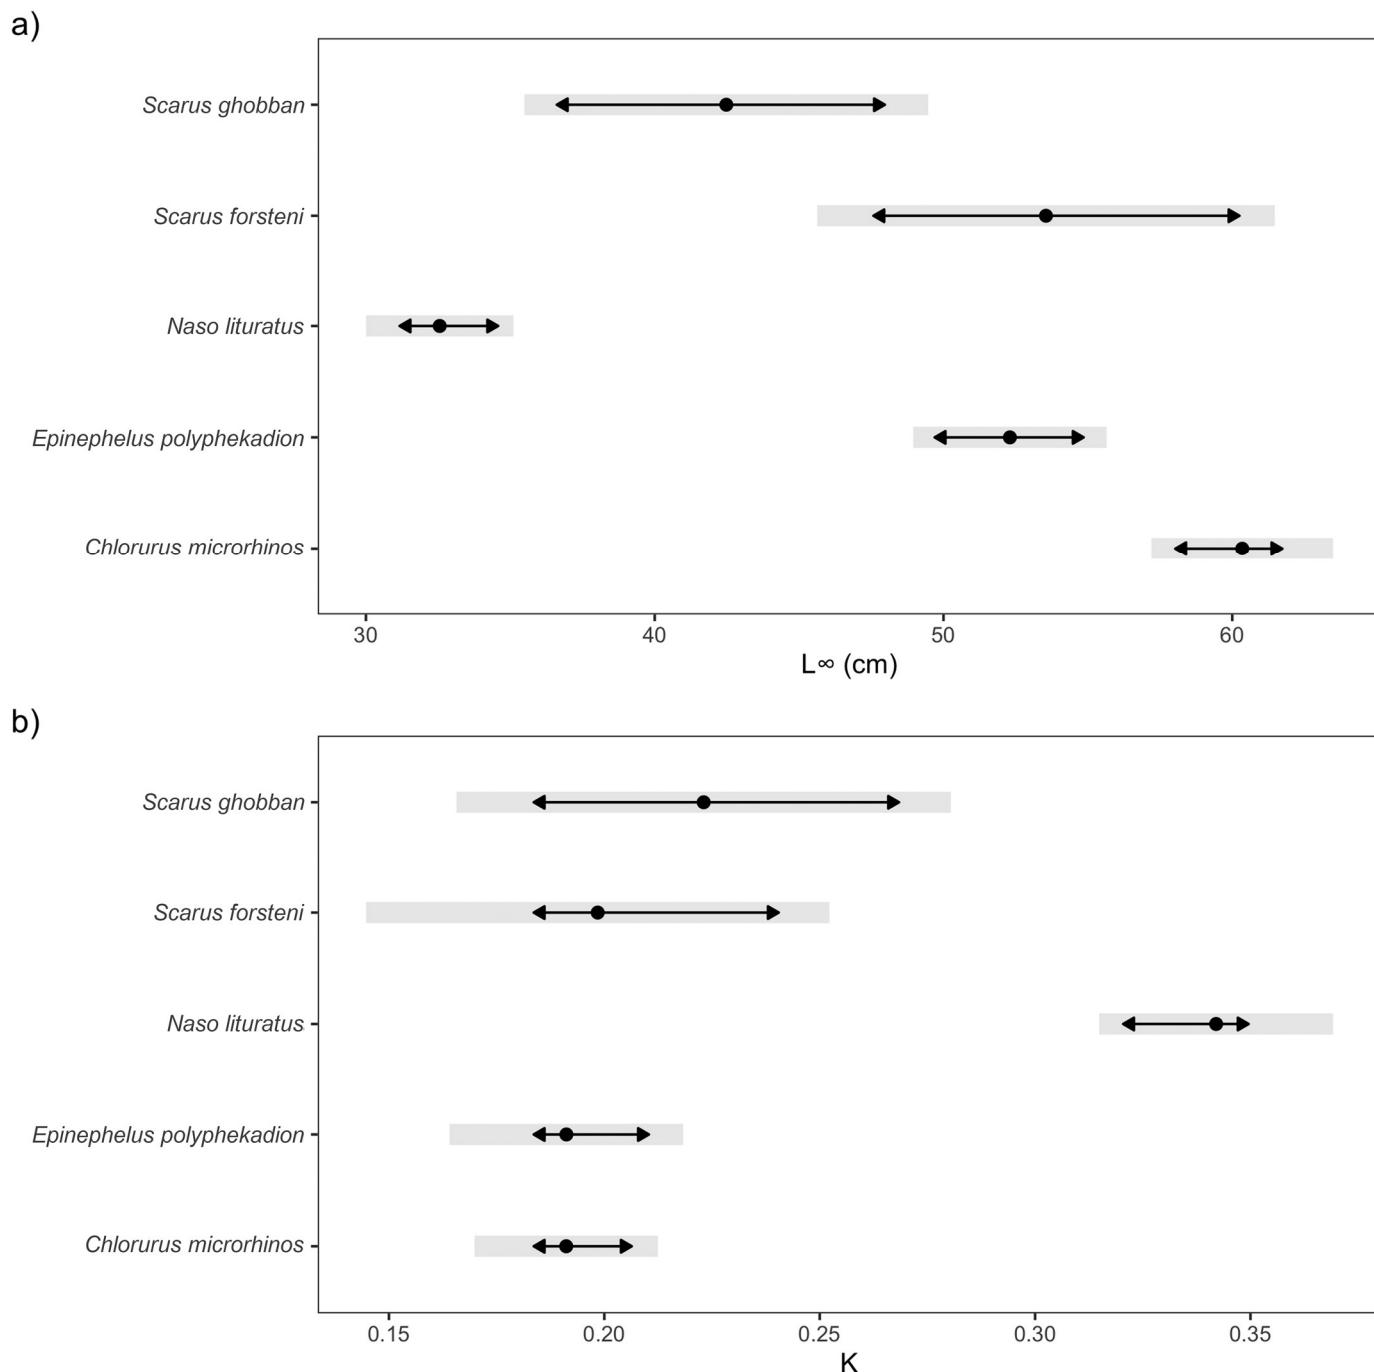

Figure S1. Post-hoc comparisons of species fixed-effects in the best non-linear mixed-effects (NLME) modeling of growth trajectories using the von Bertalanffy growth equation. (A) Asymptotic body length (L^∞). (B) Growth rate coefficient (K). Grey boxes represent 95% confidence intervals in species fixed-effect estimates. Non-overlapping arrows indicate significant differences in species estimates with Tukey post-hoc tests.

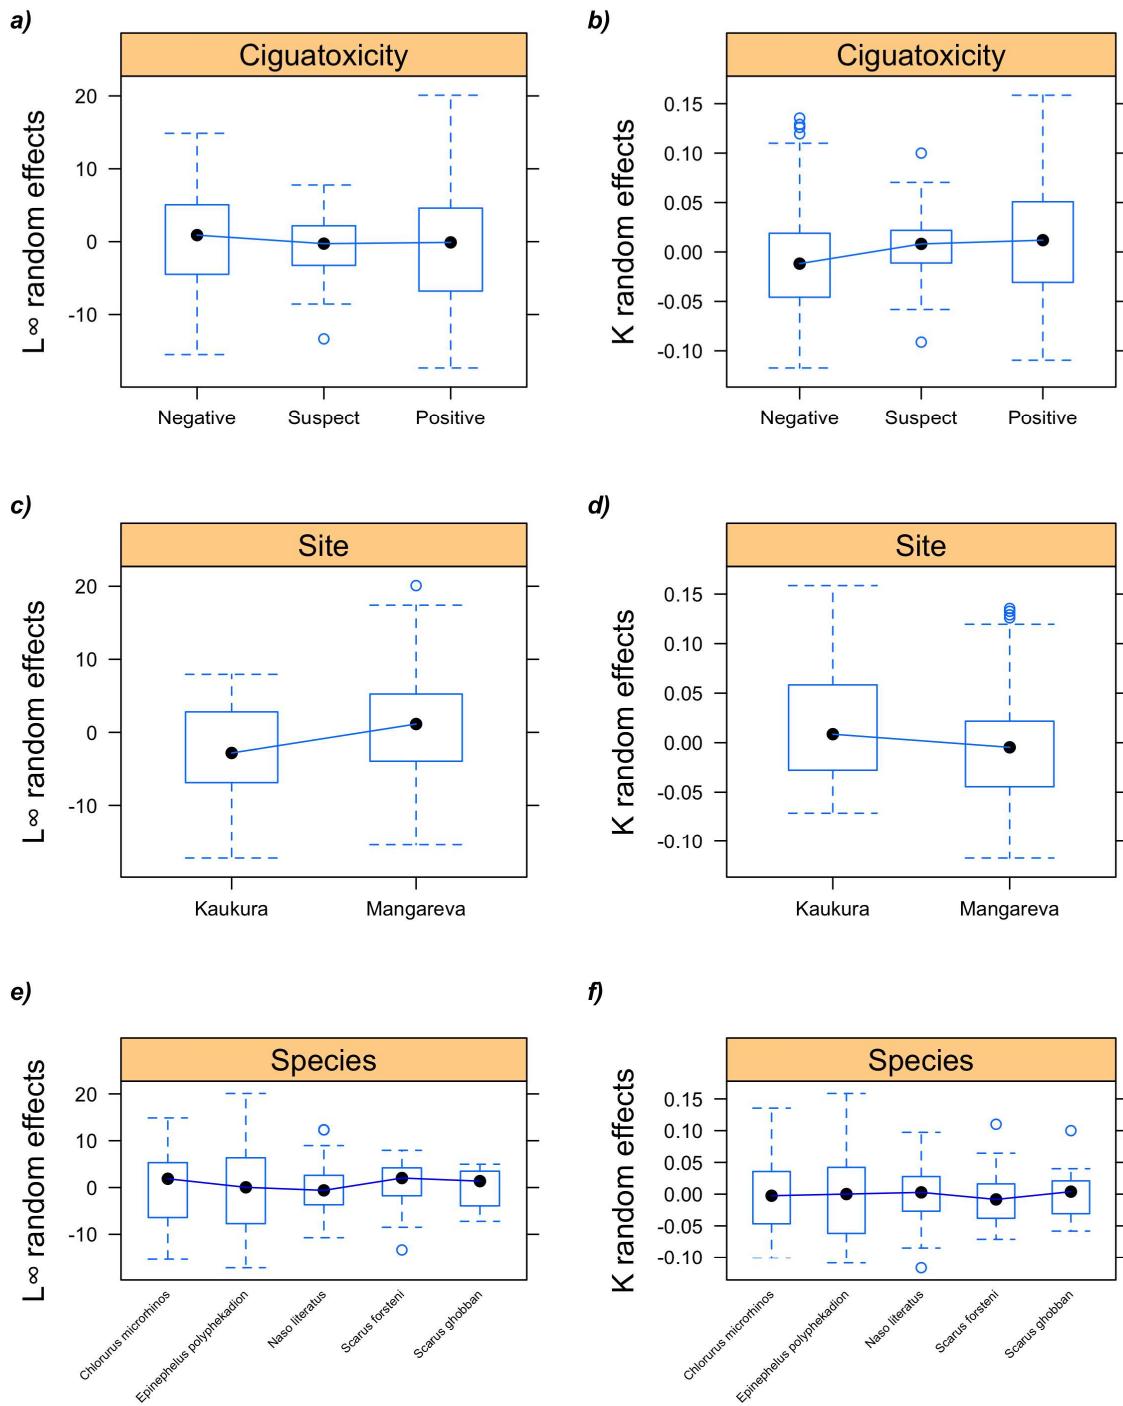

Figure S2. Distribution among ciguatoxicity classes (A,B), sites (C,D), and species (E,F) of individual variation in growth, i.e., random effects of non-linear mixed-effects (NLME) modeling of growth) for both von Bertalanffy growth rate coefficient (K) and asymptotic body length (L^∞). The plots indicate no detectable relationship between growth and ciguatoxicity or site, and that species effect was well accounted for by the model. See Table 2 for model specification.
