### **Content**

Data S1

Figure S1 and S2

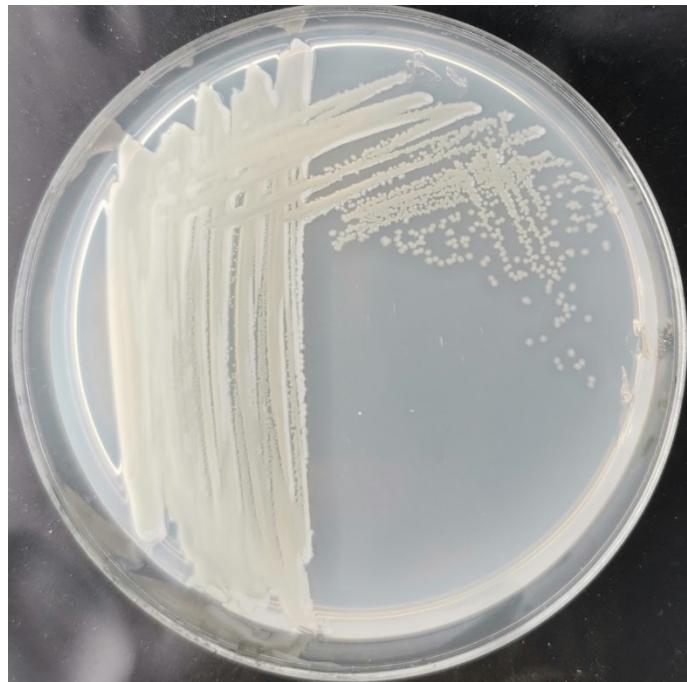

Table S1, S2, S3 and S4

**Data S1.** Information of 100 alginate-degrading strains.

**Figure S1.** Optimization of alginate lyase production conditions of strain B2Z047. Influences of different ions (A), different concentrations of  $\text{MgSO}_4$  (B) and  $\text{NaCl}$  (C), initial pHs of the culture media (D), seed

volumes (**E**), culture temperatures (**F**), bottling volumes in the flasks (**G**), and rotation speed of shaker (**H**) on the alginate lyase production. The optimum culture conditions were established on the optimal medium and all experiments were performed with three biological replicates each time and repeated more than three times. Alginate lyase activity and biomass were measured after 24 h cultivation. All medium were prepared with artificial seawater (3% NaCl, 0.23% MgCl<sub>2</sub>, 0.32% MgSO<sub>4</sub>, 0.12% CaCl<sub>2</sub>, 0.07% KCl, and 0.02% NaHCO<sub>3</sub>, w/v). The concentration of each salt added was 0.1% (**A**). The NaCl was supplemented, for example, 1% NaCl addition producing final NaCl concentration of 4% (**C**). The error bars represented the standard deviation, and asterisks denoted *p*-values for t-tests of differences from the data of MgSO<sub>4</sub> (**A**), control (**B & C**), 0.5 mL (**E**), 28°C (**F**), 25 mL (**G**) and 175 rpm (**H**): \**p* < 0.05, \*\**p* < 0.01.

**Figure S2.** The colony morphology of strain B2Z047 grew on MA plate at 30°C for two days.

**Table S1.** Four factors and three levels of orthogonal experiment.

Level	Factor			
	Sodium alginate (A, %)	Yeast extract (B, %)	NaCl (C, %)	MgSO <sub>4</sub> (D, %)
1	0.7	0.3	0	0.05
2	0.9	0.5	1	0.1
3	1.1	0.7	2	0.2

The results and analyses of orthogonal experiment:

NO.	A	B	C	D	Enzyme activity
1	1	1	1	1	0.1307
2	2	2	2	1	0.1319
3	3	3	3	1	0.1226
4	3	2	1	2	0.1333
5	2	1	3	2	0.1473
6	1	3	2	2	0.1264
7	1	2	3	3	0.1221
8	2	3	1	3	0.1085
9	3	1	2	3	0.1596
K1	0.3792	0.4376	0.3725	0.3852	
K2	0.3877	0.3873	0.4179	0.407	
K3	0.4155	0.3575	0.3920	0.3902	
R	0.0363	0.08	0.0454	0.0168	
Factor order	B>C>A>D				
Excellent level	A3	B1	C2	D2	
Excellent combination	A3B1C2D2				

K<sub>i</sub> (1,2,3) is obtained by adding any number of columns corresponding to i factor.

R is the difference between the maximum value and the minimum value of K<sub>i</sub> (1,2,3) of any columns.

**Table S2.** Function of the closest structure and structural similarity (TM-score) of alginate lyases.

Protein Name	PDB code	TM-score	Function
Aly7A1		0.859	
Aly7A2		0.813	
Aly7A3	4ozx	0.785	alginate lyase from <i>Klebsiella pneumoniae</i>
Aly7A4		0.856	
Aly7A5		0.972	
<b>Aly7B1</b>		0.979	
Aly7B2	5zu5	0.913	a full length alginate lyase with CBM domain from <i>Vibrio splendidus</i>
<b>Aly7C</b>		0.853	
<b>Aly6A</b>	7dmk	0.827	PL6 alginate lyase from <i>Bacteroides clarus</i>
<b>Aly38A</b>	3nfv	0.897	alginate lyase from <i>Bacteroides ovatus</i>
<b>Oal17A1</b>	7bjt	0.981	a new PL17 oligoalginic lyase from <i>Zobellia galactanivorans</i>
Oal17A2		0.990	

The model structures highlighted in bold type are showed in Figure 4.

**Table S3.** Genes for the alginate-degrading process in the genome of *Agarivorans* sp. B2Z047.

Gene locus	E-Value	Accession	Short name	Superfamily
<b>outermembrane porin (KdgMN)</b>				
2224	4.76606E-35	pfam06178	KdgM oligogalacturonate-specific porin	cl11629
2251	2.34382E-34	pfam13778	DUF4174	cl16390
<b>oligoalginate transporter (ToaABC)</b>				
1830	0	TIGR02121	Na_Pro_sym	cl00456
2233	2.22446E-107	cd11477	SLC5sbd_u1	cl00456
