General procedures for the synthesis of important intermediates

The general procedures for the synthesis of important intermediates **4a - 4e**, **5a - 5e** and **6a - 6c** are as follows.

1.1. General procedure for the synthesis of **4a - 4e**

The substituted phenyl acetaldehydes **3** [17] (10 mmol) and benzylamine (1.07 g, 10 mmol) were dissolved in THF (15 mL), and stirred at room temperature for 0.5 h under argon. Then AgOAc (3.34 g, 20 mmol) and NaOAc (1.64 g, 20 mmol) were added, and the mixture was stirred at 60 °C for 8 h. The mixture was cooled down to room temperature, and then the resulting precipitate was filtered and washed with EtOAc. The filtrate was evaporated under reduced pressure and the resulting residue was purified by flash column chromatography (petroleum ether: dichloromethane = 5: 1 to 3: 1) to give the pure compounds **4a - 4e**.
