

Supplementary method

This method may result in a drop-out of unmatched cases for the best matching, and thus, the number of subjects for the matching analyses were as followed; MetS: 1,038 men and 2,580 women, abnormal TG levels: 1,038 men and 2,786 women, hypertension: 1,916 men and 3,526 women, obesity: 1,412 men and 3,248 women, abnormal high-density lipoprotein cholesterol levels: 900 men and 3,884 women, abnormal fasting blood sugar: 648 men and 954 women.

Table S1. Comparison of baseline characteristics according to metabolic syndrome and abnormal triglyceride (TG) levels and differences in baseline characteristics with different propensity score-based methods in men.

Characteristics	Metabolic syndrome (N)			Standardized mean differences ^{a)} (N)				Abnormal TG levels (N)			Standardized mean differences ^{a)} (N)

HR, hazard ratio; CI, confidence interval; PS, propensity score; IPTW, inverse probability-of-treatment weighted; SMRW, standardized mortality ratio weighted. ^{a)} Adjusted by age, sex (in case of total education, smoking status, alcohol consumption, physical activity, frequency of intake of fruits or vegetables, frequency of intake of red meats, and residential area.

Supplementary Figure S1. Comparison of the standardized mean differences by covariates with different propensity score-based methods according to (a) metabolic syndrome and (b) triglyceride level in men.

Crude, whole dataset; Matched, 1:1 matched dataset; Strata5, dataset stratified into 5 strata; IPTW, inverse-probability-of-treatment-weighted dataset; SMRW, standardized mortality ratio-weighted dataset. This plot shows the standardized mean differences between study subjects who have metabolic syndrome and those who do not; a value > 0.1 indicates imbalance of a covariate.

Supplementary Figure S2. Comparison of the standardized mean differences by covariates with different propensity score-based methods according to (a) metabolic syndrome and (b) triglyceride level in women.

Crude, whole dataset; Matched, 1:1 matched dataset; Strata5, dataset stratified into 5 strata; IPTW, inverse-probability-of-treatment-weighted dataset; SMRW, standardized mortality ratio-weighted dataset. This plot shows the standardized mean differences between study subjects who have metabolic syndrome and those who do not; a value > 0.1 indicates imbalance of a covariate.
