OxCGRT data

To adjust the differences between policies, each variable was divided by possible maximum level of each data and multiplied by 100 thus having range between 0 to 100. If the policy has flag, which indicates whether the policy was implemented generally in a country or locally, it was treated with additional level of 1, for the policy while increasing maximum level too by 1.

$$Index = \frac{policy\ level}{max\ level} \quad (\text{without flag}) \quad (S1)$$

$$Index = \frac{policy\ level + flag}{max\ level + 1} \quad (\text{with flag}) \quad (S2)$$

Table S1: Summary of Policy Variables Used for Analysis. The 13 government implemented policies recorded on an ordinal scale that represents the strength of the policy.
