## Supplementary Material

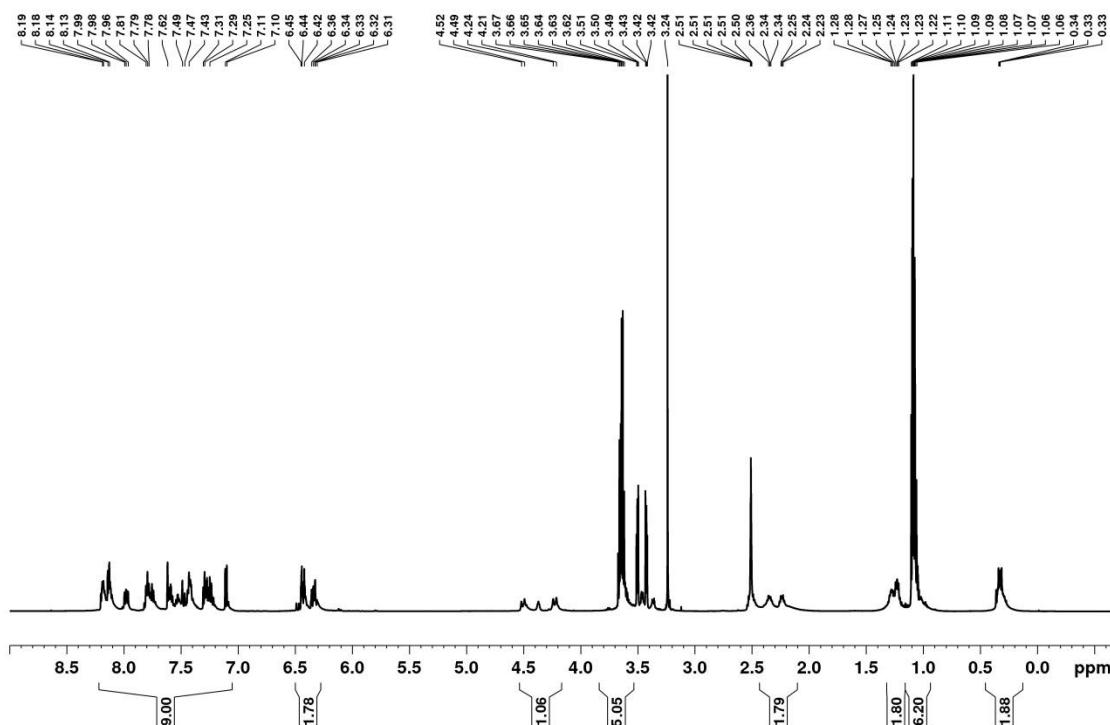

Figure S1. <sup>1</sup>H NMR spectrum of DAPTES in DMSO-d6.

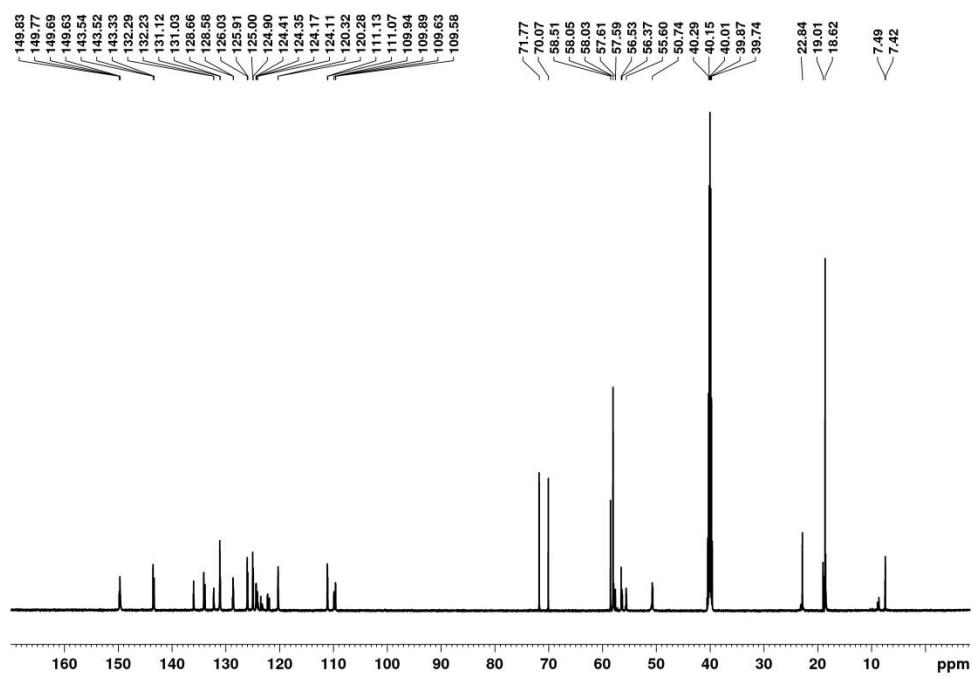

Figure S2.  $^{13}\text{C}$  NMR spectrum of DAPTES in DMSO-d6.

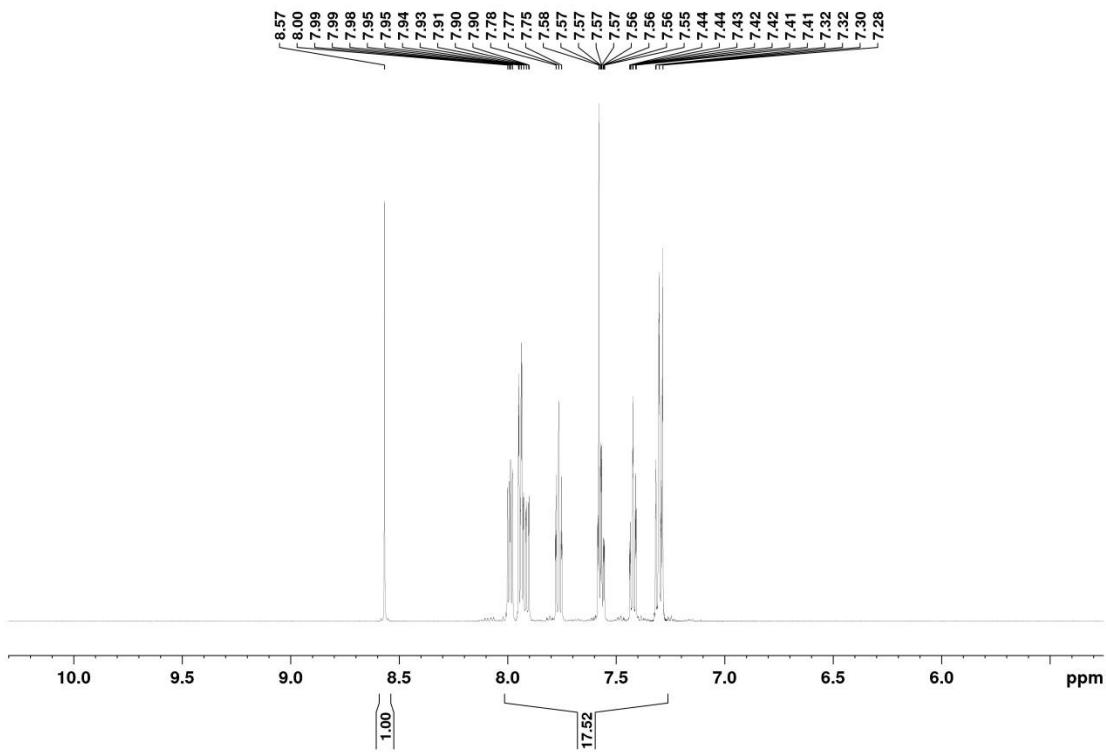

Figure S3.  $^1\text{H}$  NMR spectrum of DOPO in  $\text{CDCl}_3$ .

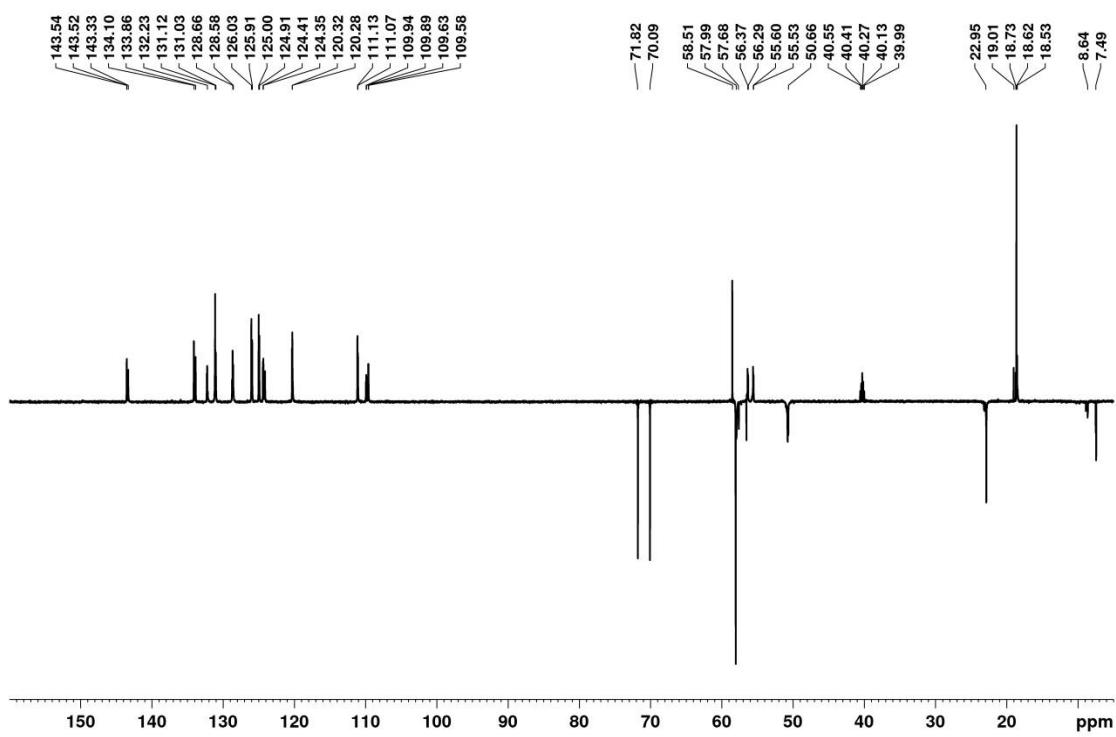

Figure S4. DEPT-135 NMR spectrum of DAPTES in DMSO-d<sub>6</sub>.

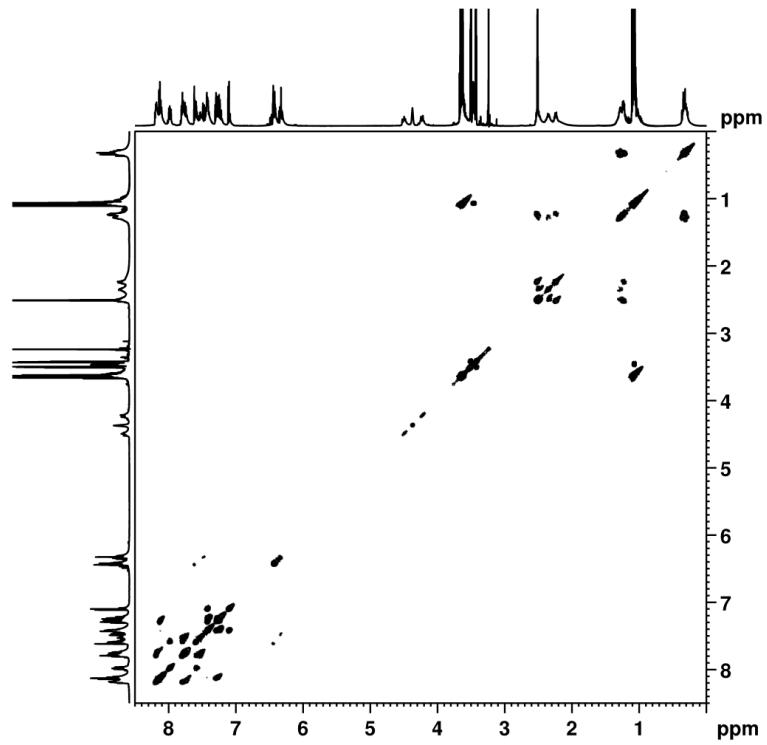

Figure S5. COSY spectrum of DAPTES in DMSO-d<sub>6</sub>.

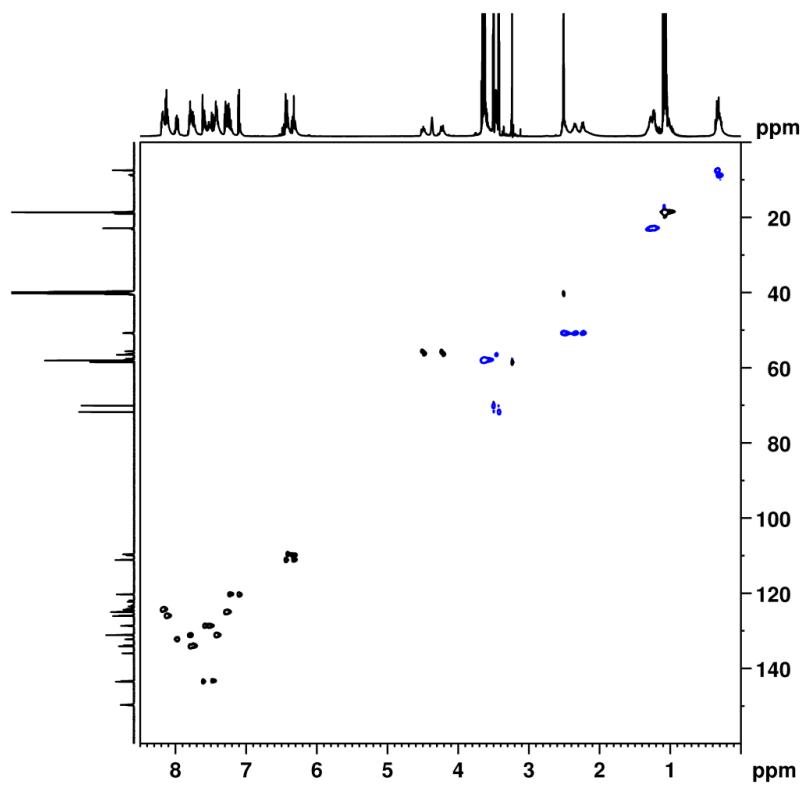

Figure S6.  $^1\text{H}$ - $^{13}\text{C}$  HSQC spectrum of DAPTES in DMSO-d6.

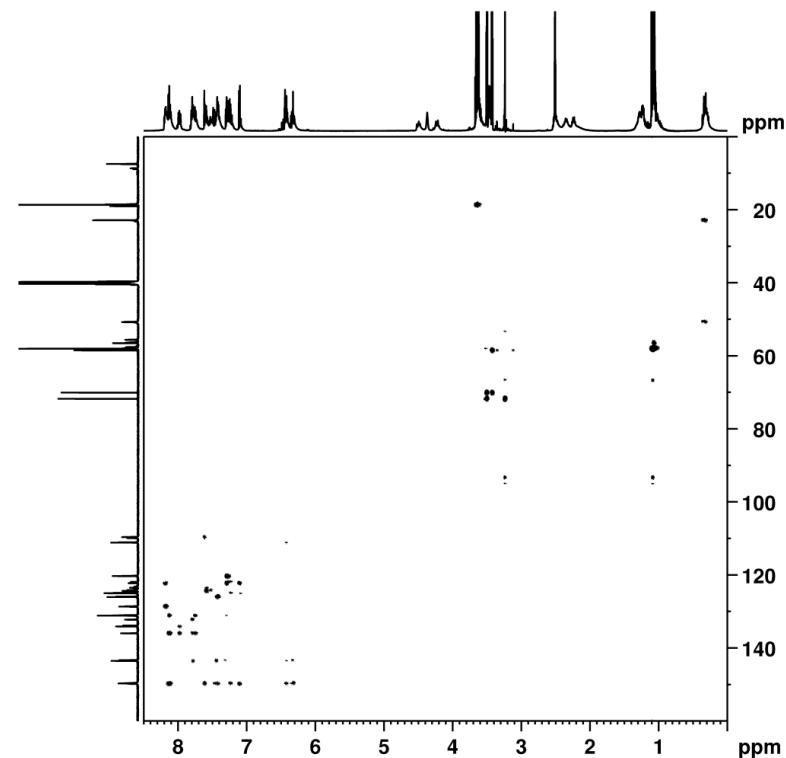

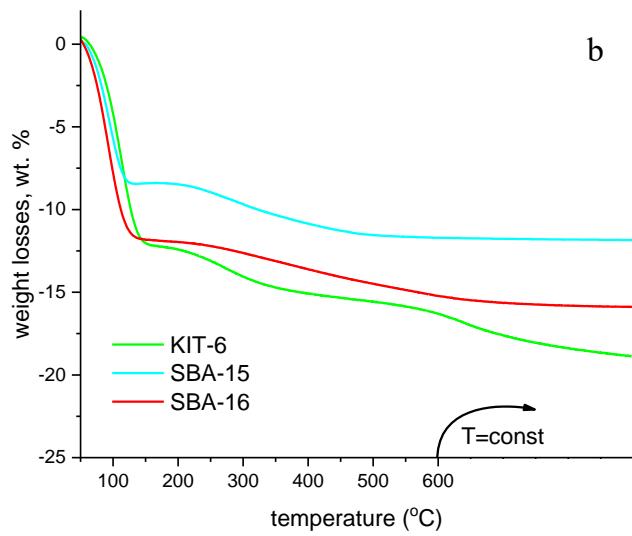

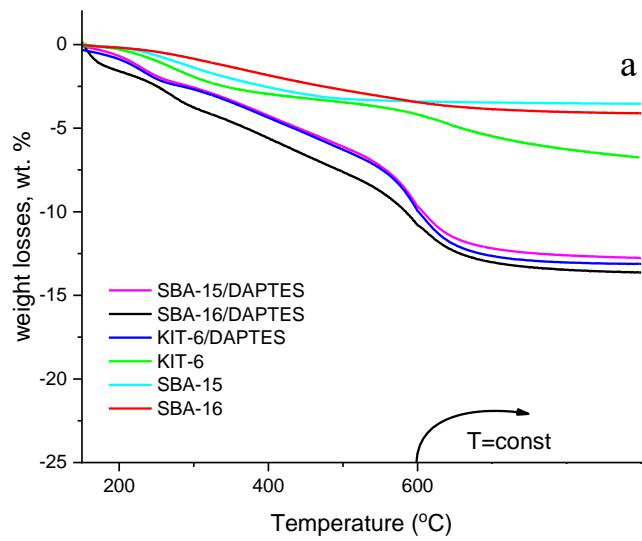

Figure S7.  $^1\text{H}$ - $^{13}\text{C}$  HMBC spectrum of DAPTES in DMSO-d6.

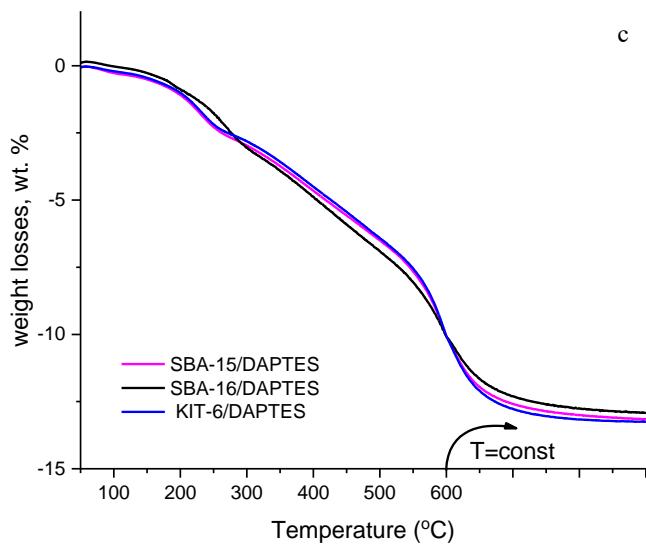

Figure S8. a) TG curves of the initial and the DAPTES-modified silicas in the temperature range 150 °C – 600 °C used to determine the weight loss due to decomposition of the grafted moieties;

b) TG curves of the initial silicas in the temperature range 50 °C – 600 °C. The weight loss up to 120 °C – 130 °C is due to adsorbed humidity;

c) TG curves of the modified silicas in the temperature range 50 °C – 600 °C. The weight loss at 150 °C is less than 0.5% which is evidence for the hydrophobization of the pore surface as a result of DAPTES grafting and the thermal stability of the DAPTES moieties.

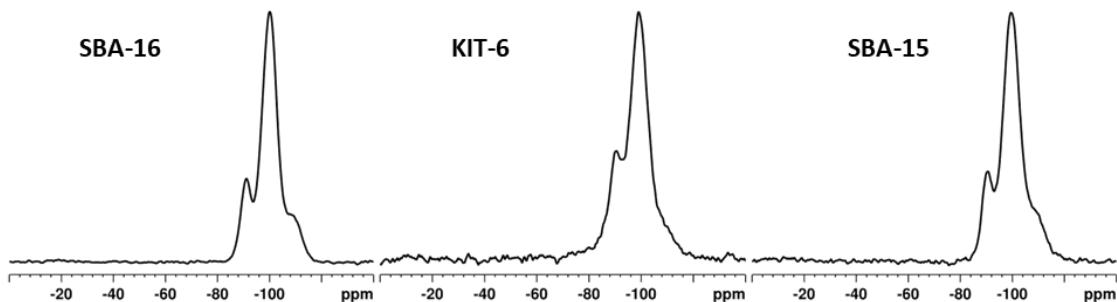

Figure S9.  $^{1}\text{H}\rightarrow^{29}\text{Si}$  CP MAS spectra of parent SBA-16, KIT-6 and SBA-15.

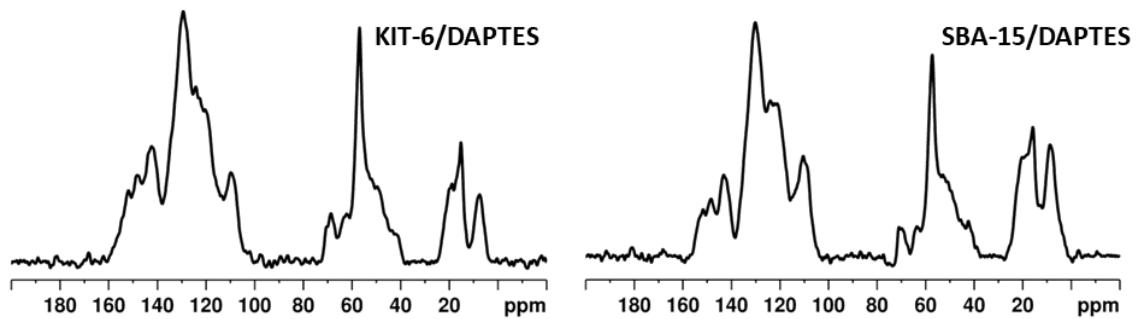

Figure S10.  $^1\text{H}\rightarrow ^{13}\text{C}$  CP MAS spectra of KIT-6/DAPTES and SBA-15/DAPTES samples.

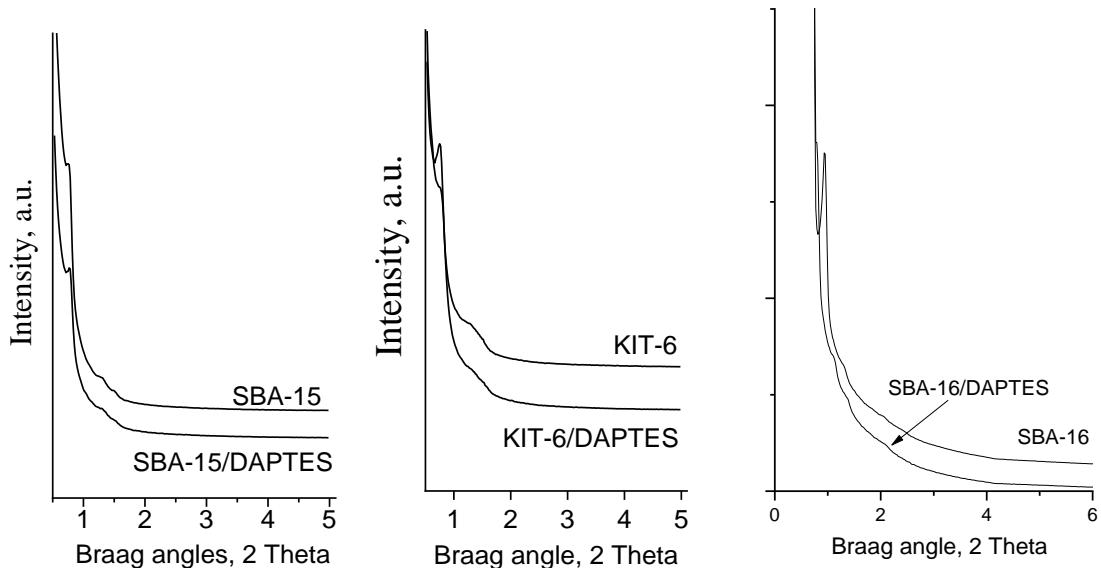

Figure S11: Low angle XRD patterns of the SBA-15, KIT-6 and their DAPTES-modified analogs

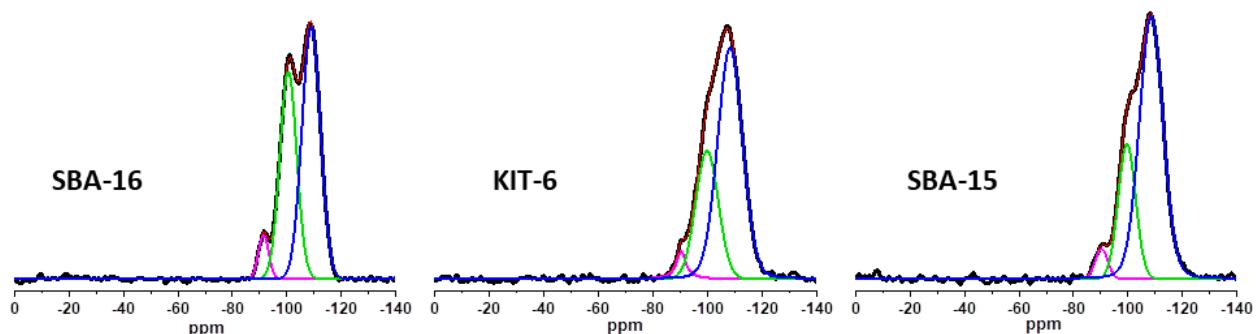

Figure S12. Experimental (black) and simulated (red) single-pulse  $^{29}\text{Si}$  NMR spectra of the a) SBA-16, b) KIT-6, c) SBA-15. The individual contributions of the different Si environments

obtained by the deconvolution of the spectral patterns are given with colored lines ( $Q^4$  - blue,  $Q^3$  - green,  $Q^2$  - magenta).

The results from the deconvolution of the spectra with DMFit software [D. Massiot, F. Fayon, M. Capron, I. King, S. Le Calve, B. Alonso, J.O. Durand, B. Bujoli, Z. Gan, G. Hoatson, Modelling one- and two-dimensional solid-state NMR spectra. Magnetic Resonance in Chemistry 40 (2002), 70-76] are summarized in Table S1.

Table S1. Area of the signals of the different Si structural units, obtained by deconvolution of the spectral patterns in the quantitative single pulse  $^{29}\text{Si}$  NMR spectra of the parent mesoporous silica materials.

Sample	$Q^4$ (Si,0OH) -108 ppm	$Q^3$ (Si,1OH) -100 ppm	$Q^2$ (Si,2OH) -90 ppm
SBA-16	54	<b>41</b>	5
KIT-6	65	<b>31</b>	4
SBA-15	70	<b>26</b>	4

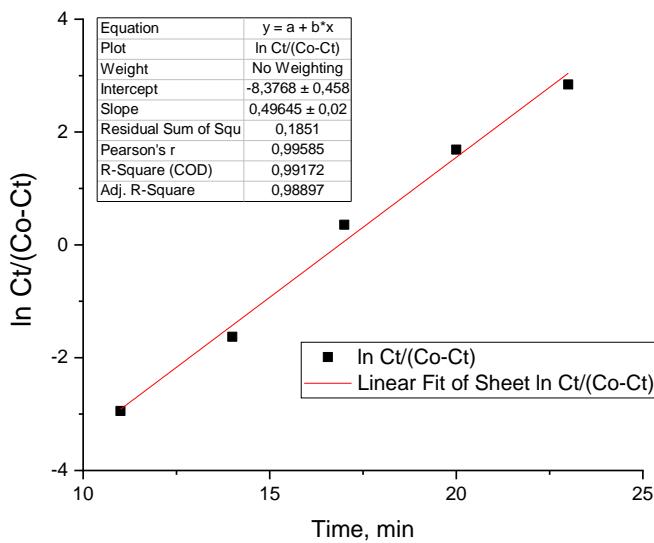

Figure S13. Fitting of experimental data on kinetic model at 0 °C.
