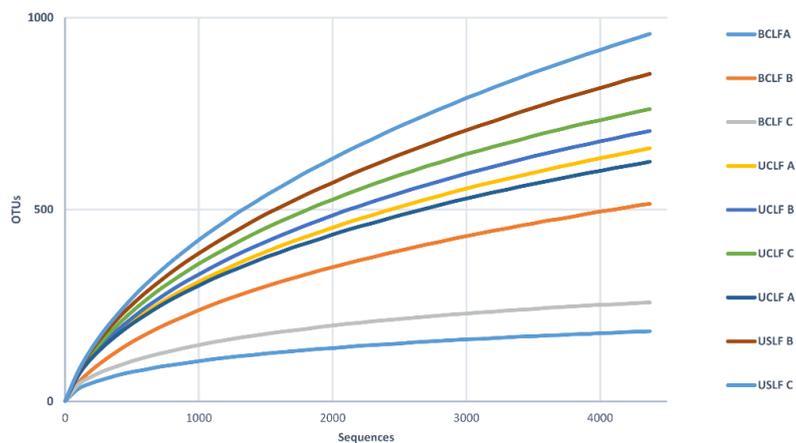

Figure S1. Rarefaction normalized curve calculated at OTU level (97% sequence similarity). Sampling sites correspond to USLF (unburned slope laurel forest), UCLF (unburned crest laurel forest) and BCLF (burned crest laurel forest). A, B and C refer to replicates for each sampled soil. Samples were normalized to 4370 sequences.

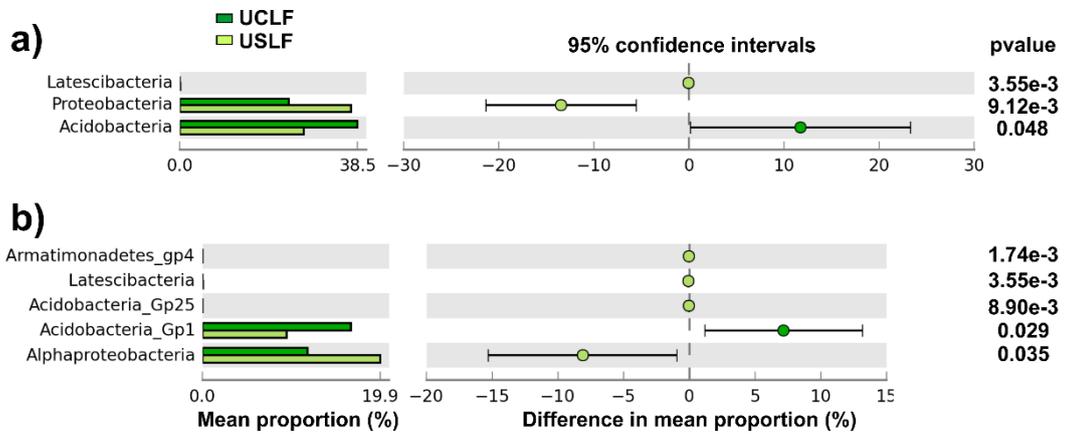

Figure S2. Significant differences at phylum level (a) and class level (b) between the soil microbiomes of the unburned laurel forests on the crest and slope (UCLF and USLF), at 95% confidence interval.

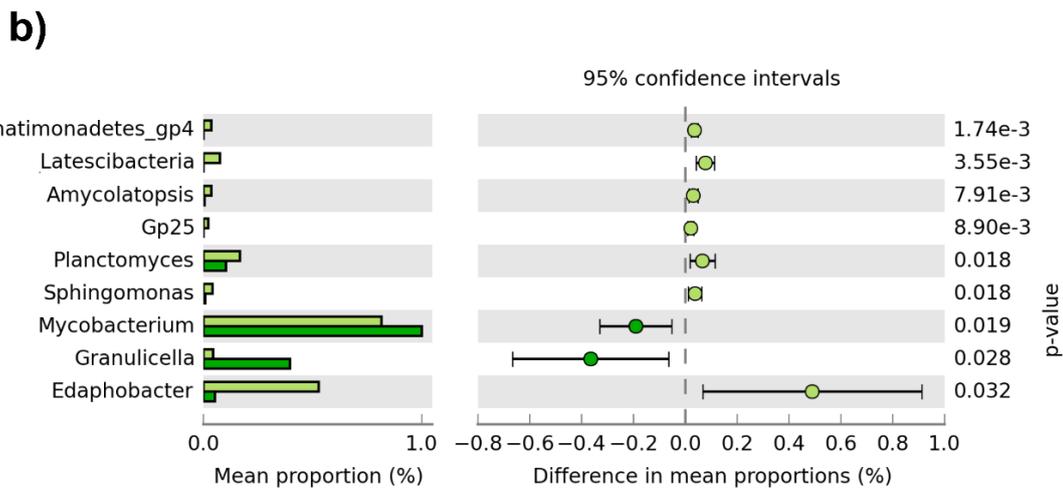

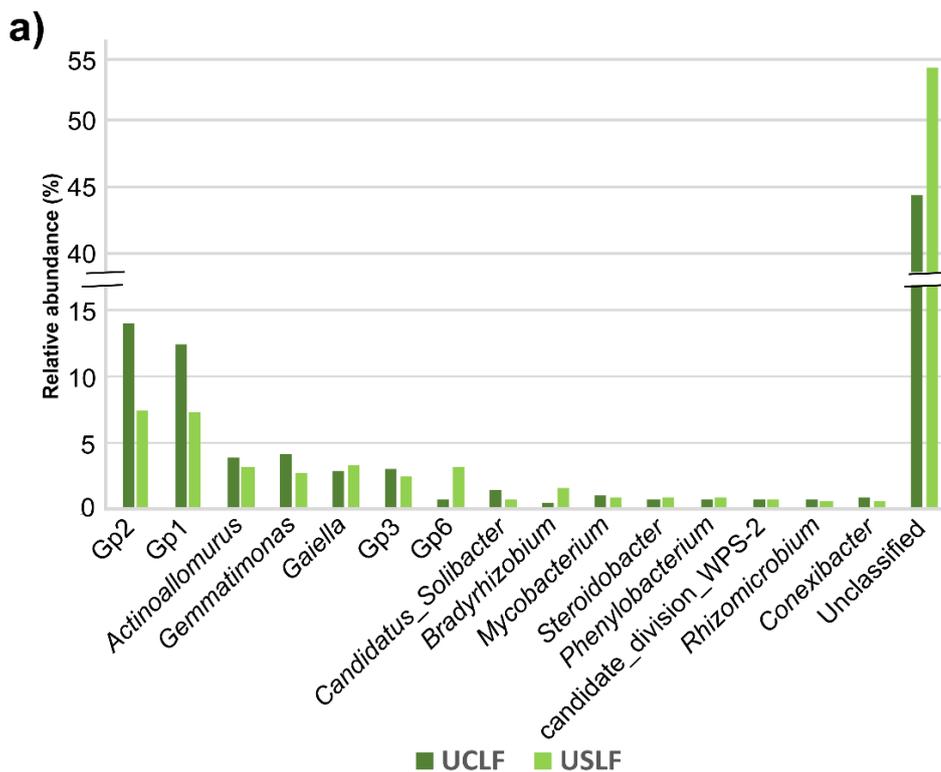

Figure S3. The soil microbiome in the unburned laurel forest soils. **(a)** Relative abundance at the genus level in the soil microbiome from undisturbed laurel forest on the crest and slope (UCLF and USLF) of the mountain. Only the genera above 0.7% relative abundance in some of the three locations are shown. ‘Others’ represent less abundant genera (below 0.7%). Unclassified: sequences showing no homology with currently described genera. Asterisk (*) indicates significant differences (STAMP at 95% confidence interval). **(b)** Genera with statistically significant differences in soils from unburned crest and slope laurel forests (UCLF and USLF) obtained by a t-test (at 95% confidence).

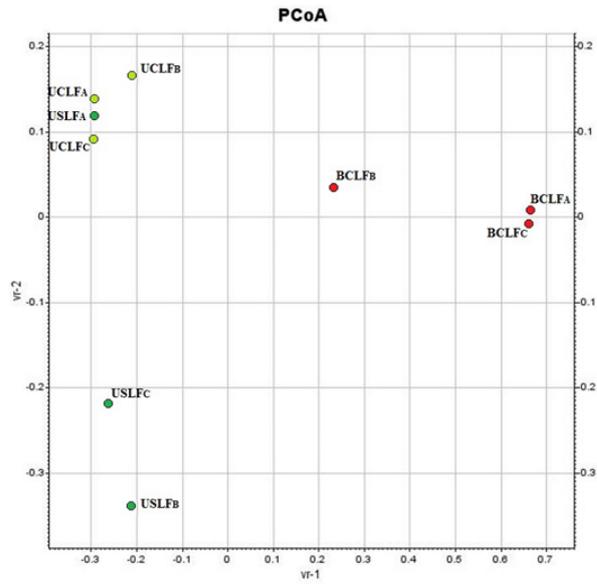

Figure S4. Principal Coordinate Analysis (PCoA) based on 16S rRNA gene sequences classified at genus level from unburned and burned laurel forest soils. USLF, Unburned Slope Laurel forest; UCLF, Unburned Crest Laurel Forest and BCLF, Burned Crest Laurel Forest.

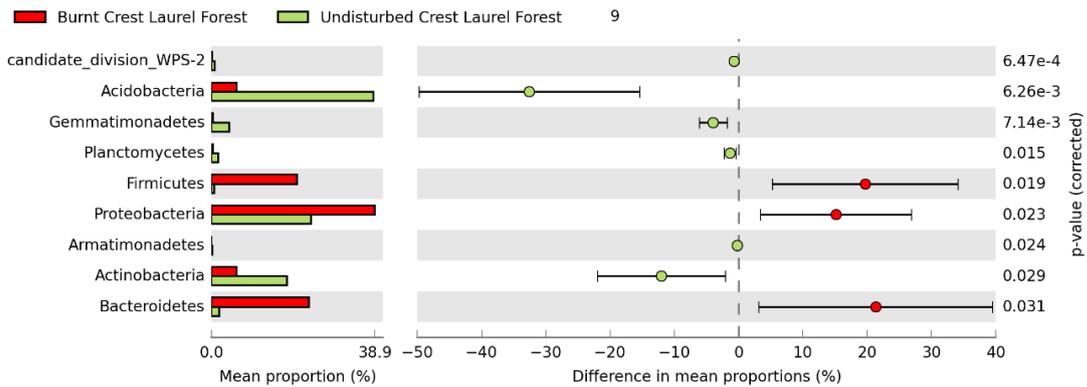

Figure S5. Phyla with statistically significant differences in soils from unburned crest forest (UCLF) and burned crest forest (BCLF), at 95% confidence interval.

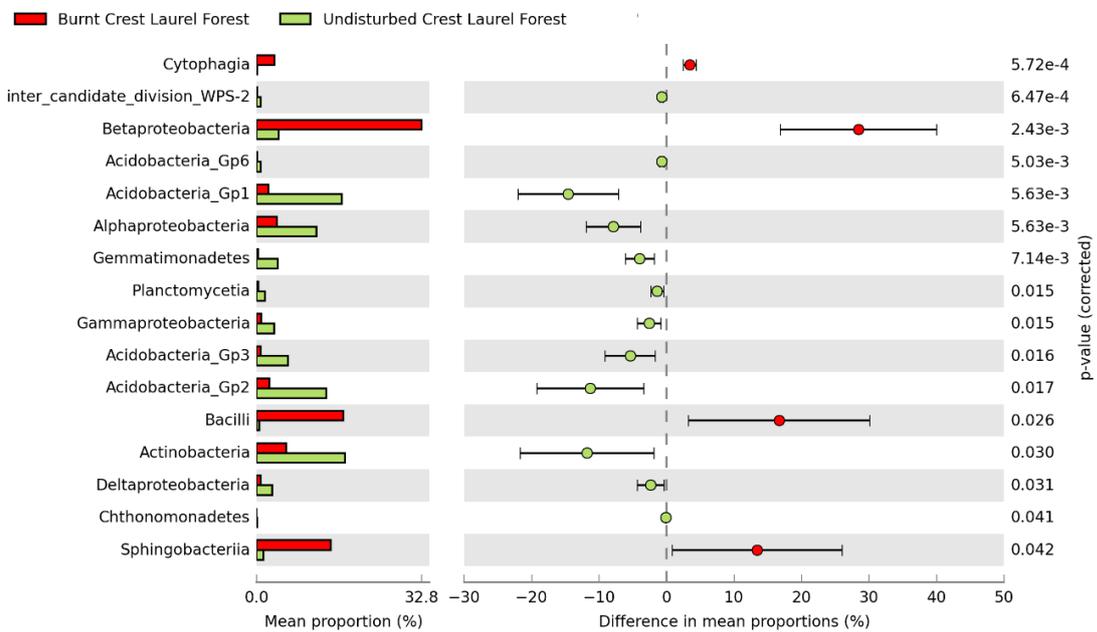

Figure S6. Classes showing statistically significant differences in soils from burned crest forest (BCLF) and unburned crest forest (UCLF) (with t test, 95% confidence interval).

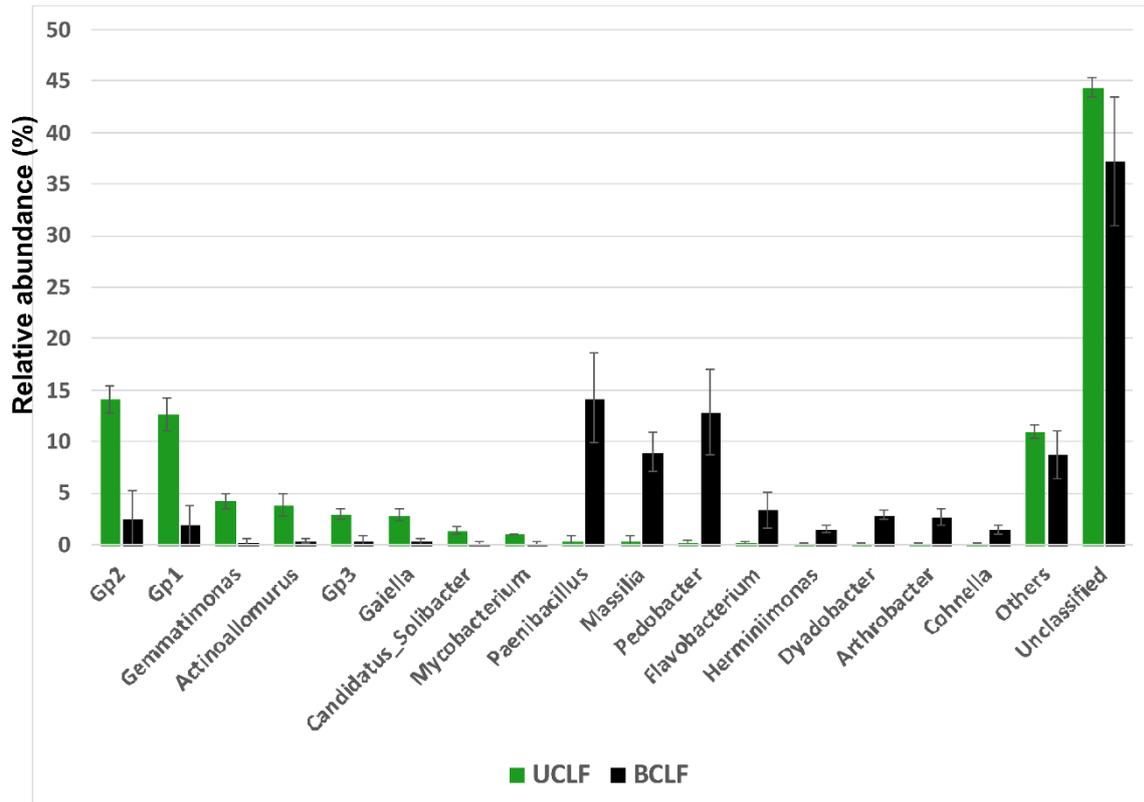

Figure S7. Relative abundance of genera in the bacterial communities from soils in unburned crest laurel forest (UCLF) and in a crest forest burned after a wildfire (BCLF). Only genera with relative abundance above 1% in at least one location are shown, while less abundant genera are under ‘Others’. Unclassified: sequences with no homology with currently described genera.

PCA (Correlation Biplot)

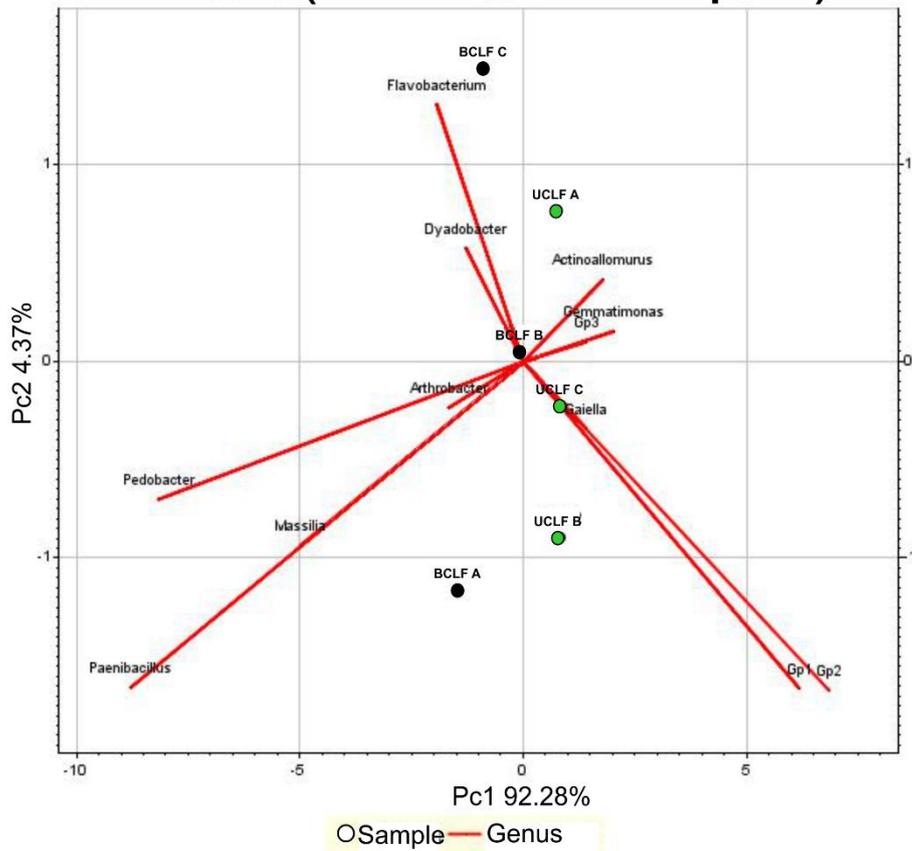

Figure S8. Principal component analysis (PCA) plot of the genera distribution (only genera above 1% are shown) in unburned (UCLF) and burned (BCLF) crest laurel forest soils.

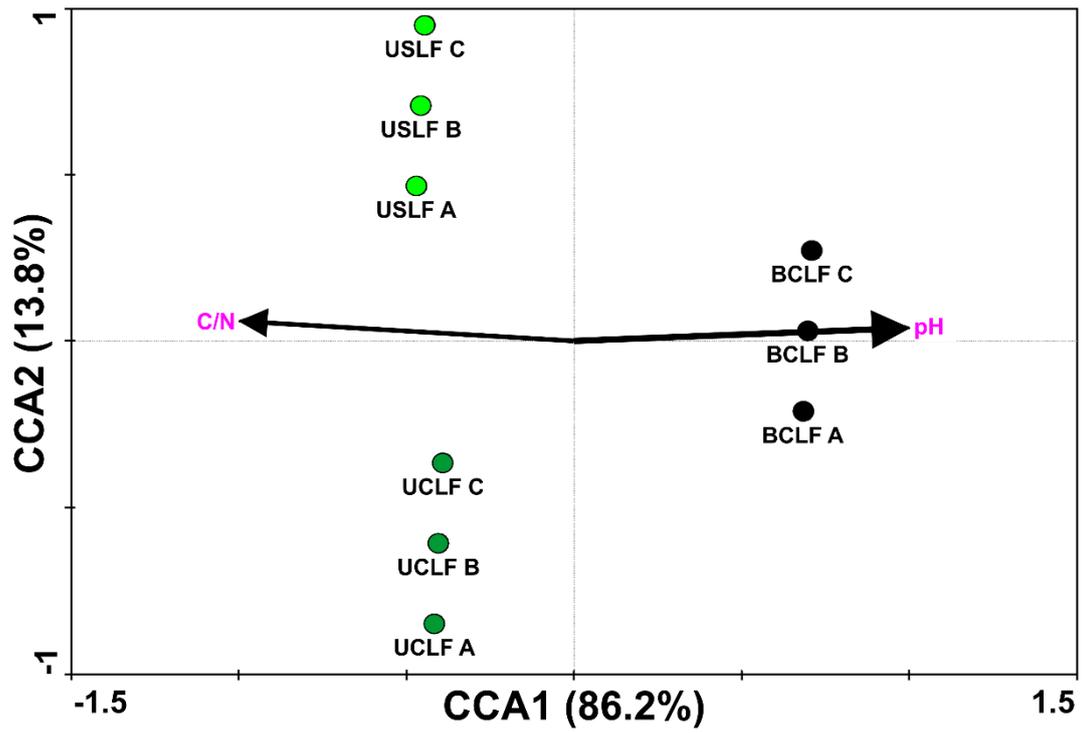

Figure S9. Canonical correspondence analysis (CCA) of 16S rRNA gene sequences (at genus level) in the three types of soil samples. Pink colour indicates vectors of environmental variables significantly influencing genera distribution. USLF, Unburned Slope Laurel Forest; UCLF, Unburned Crest Laurel Forest and BCLF, Burnt Crest Laurel Forest.

Table S1. Genera with percentage of exclusive sequences above 0.1% and detected OTUs in soils from an undisturbed laurel forest growing on the mountain slope (USLF).
