

Table S1. Thirty-year post-treatment measures of shrub relative abundance (% of total), total stems ha⁻¹, and relative biomass (% of total) for the two phases (*Menziesia ferruginea*, MFE; *Xerophyllum tenax*, XETE) of the *Abies lasiocarpa/Clintonia uniflora* habitat type [50] and the subsequent 11 disturbance categories at the Miller Creek Demonstration Forest, Montana, USA (see Table 1 for descriptions). For treatments, H = harvested; P = prescribed fire; W = wildfire; and C = control. N-fixing plants in **bold**. T = < 0.5. Data available at [133].

Table S3. Thirty-year post-treatment measures of tree relative abundance (% of total) and relative biomass (% of total) for the two phases (*Menziesia ferruginea*, MEF; *Xerophyllum tenax*, XETE) of the *Abies lasiocarpa/Clintonia uniflora* habitat type [50] and the subsequent 11 disturbance categories at the Miller Creek Demonstration Forest, Montana, USA (see Table 1 for descriptions). For treatments, H = harvested; P = prescribed fire; W = wildfire; and C = control. T = < 0.5.

Table S4. Thirty-year post-treatment measures (mean with standard deviation in parentheses) of biomass and nitrogen in vegetation (herbaceous, shrub, seedling, tree, fine and coarse roots), woody residue, and soil (forest floor, mineral soil, soil wood) for the two phases (*Menziesia ferruginea*, MEFE; *Xerophyllum tenax*, XETE) of the *Abies lasiocarpa Clintonia uniflora* habitat type [50] and the subsequent 11 disturbance categories at the Miller Creek Demonstration Forest, Montana, USA (see Table 1 for descriptions). Different letters within rows represent significantly different values at $\alpha = 0.1$. For treatments, H = harvested; P = prescribed fire; W = wildfire; and C = control.

Table S5. Mean (standard deviation) nitrogen concentrations by tissue type (wood or foliage) and stem basal diameter (< 2 or >2 cm) for tree and shrub species observed on the 11 disturbance categories at the Miller Creek Demonstration Forest, Montana, USA (see Table 1 for descriptions). Means and *p*-values in **bold** indicate appropriateness for pooling samples across basal stem diameters. Means and *p*-values in *italics* are the overall value for wood (branches) or foliage within plant types (tree seedlings, shrubs, or N-fixing shrubs). Within plant types, different letters indicate significant differences at $\alpha=0.1$.
