

Supplemental figure 1. A) Scheme of the infection experiments. Colour code: grey = infection experiments; blue = blood-fed controls. B) Strategy used to study the small RNA profile of nrEVEs. To test how individual small RNAs are expressed, single molecules were counted and referred to all nrEVEs they mapped (level 1). To analyse the total small RNA profile of each nrEVE, all the small RNA molecules mapping within the boundaries of individual nrEVEs were considered (level 2)
