

Supplemental Data

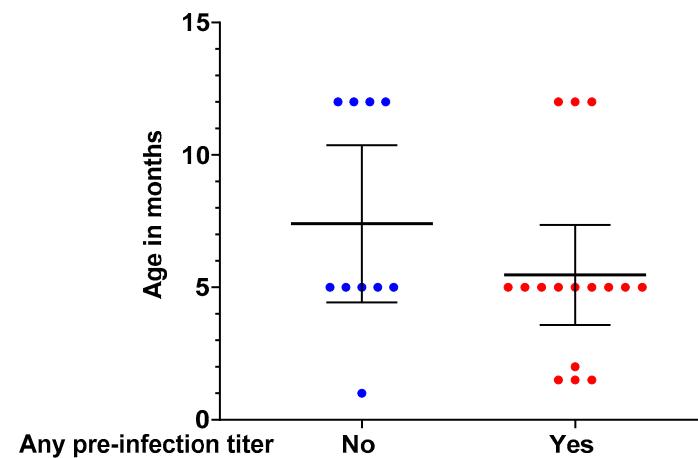

Figure S1. Age does not associate with pre-infection serum blockade antibody seroprevalence in this cohort. Children were stratified by detectable levels of pre-infection blockade antibody titer and age. Age at sample collection was not different between children with and without pre-infection blockade antibody titer (Mann-Whitney test, $p = 0.26$). Marker, one child. Line and error bars; mean and 95% CI. Y axis; age in months.

Table S1. Summary metrics to genogroup II human norovirus strains among the child cohort.

Subject number	Age at pre-blood draw months	B			C			GII.4 2006b			GII.4 2012			GII.12			GII.14			GII.17			RT-qPCR	Seroconverted to infecting genotype	Serology matches asymptomatic-symptomatic PCR	Pre infection titers
