## List of Figures and Tables:

**Figure S1.** Calibration curve of ELISA.

**Table S1.** ELISA performance validation parameters.

**Tables S2.** Serum IgG-A7 concentration values in CD-1 mice i.v. administered with the single dose of 100 mg/kg.

**Tables S3.** Serum IgG-A7 concentration values in CD-1 mice i.v. administered with the single dose of 200 mg/kg.

**Table S4.** Hematology summary of CD-1 mice 14 days after i.v. treatment with IgG-A7.

**Table S5.** Blood chemistry summary of CD-1 mice 14 days after i.v. treatment with IgG-A7.

**Table S6.** Mouse TCR.

**Table S7.** Human TCR.

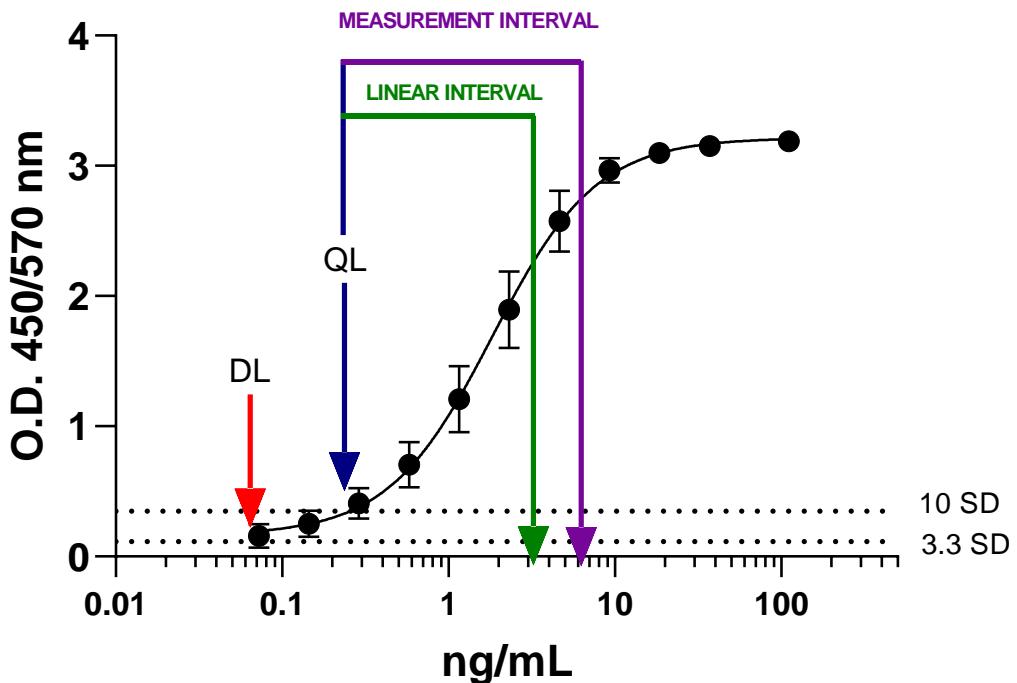

## ELISA Validation:

The parameters of the ELISA validation were established according to the suggested in the M10 ICH Harmonized Guideline for validation of bioanalytical methods and sample analysis. The parameters evaluated included selectivity, specificity, precision, accuracy and dilution linearity and Hook effect.

An IgG-A7 calibration curve was generated by fitting the raw data to a four-parameter (4PL) model. From this curve, the linear and quantification intervals were established, as well as the detection (DL) and quantification (DQ) limits. Specificity was determined as the ability to detect different anti-RBD antibodies, in addition to IgG-A7, including CB6, Bebtelovimab. The anti-lysozyme D1.3 antibody was used as negative control. Selectivity was established through the detection of IgG-A7 in different matrices (MPBST 3%, serum, hemolyzed serum and plasma). The precision was evaluated through the coefficient of variation (CV) of the results obtained intra- and inter-assay.

Accuracy was assessed by the ability to detect IgG-A7 at concentrations similar to those expected in serum samples from previously treated mice. Untreated serum samples were spiked with a 1 mg/mL spike of IgG-A7 (Average concentration estimated from the amount of antibody administered to the mice). Subsequently, serial dilutions was performed to evaluate the recovery by comparing the calculated concentration with the percentage of recovery. Further, the dilutional linearity was

determined to rule out a Hook effect and the linear range of the dose-response curve was selected to obtain the measurement interval IgG-A7 in the serum samples.

**Figure S1.** ELISA Calibration Curve. DL, Detection Limit; QL, Quantification Limit

**Table S1.** ELISA performance for the quantification of IgG-A7 in serum.

Attributes	Parameters	Value
Calibration Curve	Linearity	$R^2 \geq 0.9$
	Detection Limit (DL)	0.07 ng/mL
	Quantitation Limit (QL)	0.29 ng/mL
	Dynamic Range	0.07 – 100 ng/mL
Precision	Repeatability (%CV)	0.3 – 15.67 %
	Intermediate precision	0.84 – 11.42 %
Specificity	Anti-SARS-CoV-2 antibodies	Curve dose response $R^2 \geq 0.9$
	Non-related antibodies to SARS-CoV-2	Non-curve dose-response
Selectivity	Matriz signal (serum, hemolyzed serum, plasma)	Signal similar to blank
Accuracy	Recovery (%)	108.9 – 125.5 %

## Hematological analysis:

Ten hematological parameters were measured, and the values were compared with reference ranges of CD-1 mice [https://www.criver.com/products-services/find-model/cd-1r-igs-mouse?region=3616]. The results showed no significant differences between the treated groups with single doses of 100 and 200 mg/kg of IgG-A7 and control group (no antibody). The values are reported in the table below.

**Table S4.** Hematological parameters summary in CD-1 mice, 14 days after i.v. administration of IgG-A7.

## Blood chemistry:

The values of 16 analytes in blood samples were measured. Statistically significant differences were observed in total protein, globulins, calcium and phosphorus in females of all groups, and calcium and phosphorus in males. No significant differences were observed in the quantification of the other parameters evaluated. The results of the blood chemistry evaluation are shown in the following table.

**Table S5.** Blood chemistry summary in CD-1 mice, 14 days i.v. post-administration of IgG-A7.
