1. Calibration Curve

Beta-cyclodextrin (β -CD) and a carbonate standard (diphenyl carbonate; DPC) were mixed together in an increasing molar ratio of 1:1 to 1:8. KBr pellets were prepared by keeping a constant weight for each pellet and FTIR spectra were recorded. A calibration curve was plotted in between I_{1774}/I_{2929} peak ratio vs. molar ratio of β -CD to DPC.

I_{1774} corresponds to the C=O stretching vibration of cross-linker and I_{2929} corresponds to the C-H stretching vibration of β -CD.

A linear calibration curve with a regression coefficient of 0.9971 was obtained.

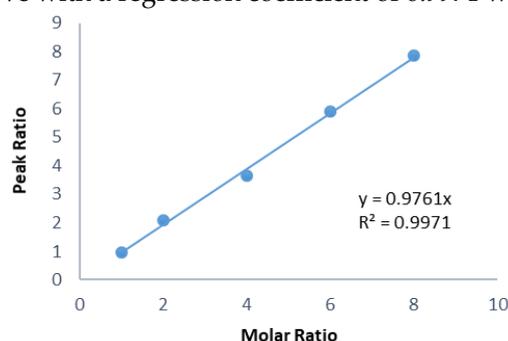

Figure S1. Calibration Curve of β -CD and carbonate standard.

Comparison of reference (β -CD: DPC; 1:4) and sample (nanosponges) spectra are shown below.

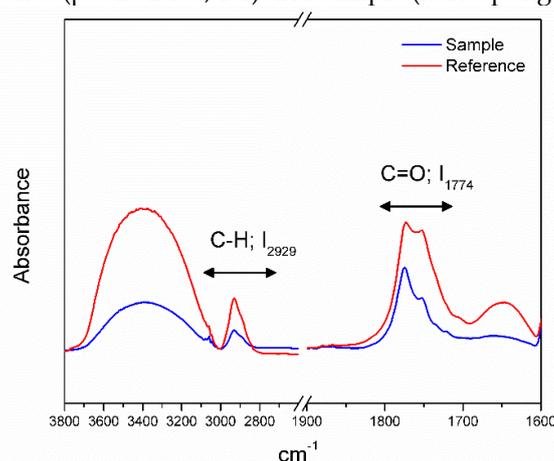

Figure S2. Reference and sample FTIR spectra.

Table S1. Crosslinking density determination.

Nanosponges	Standard		Sample		% Crosslinking = Sample I_{1774}/I_{2929} Value \div Reference I_{1774}/I_{2929} Value * 100
	Molar Ratio (Crosslinker: β - CD)	Reference I_{1774}/I_{2929} Value	Sample I_{1774}/I_{2929} Value	Calculated Molar Ratio (Crosslinker: β - CD)	
CDNSs	4	3.650	2.920	2.99	80%
