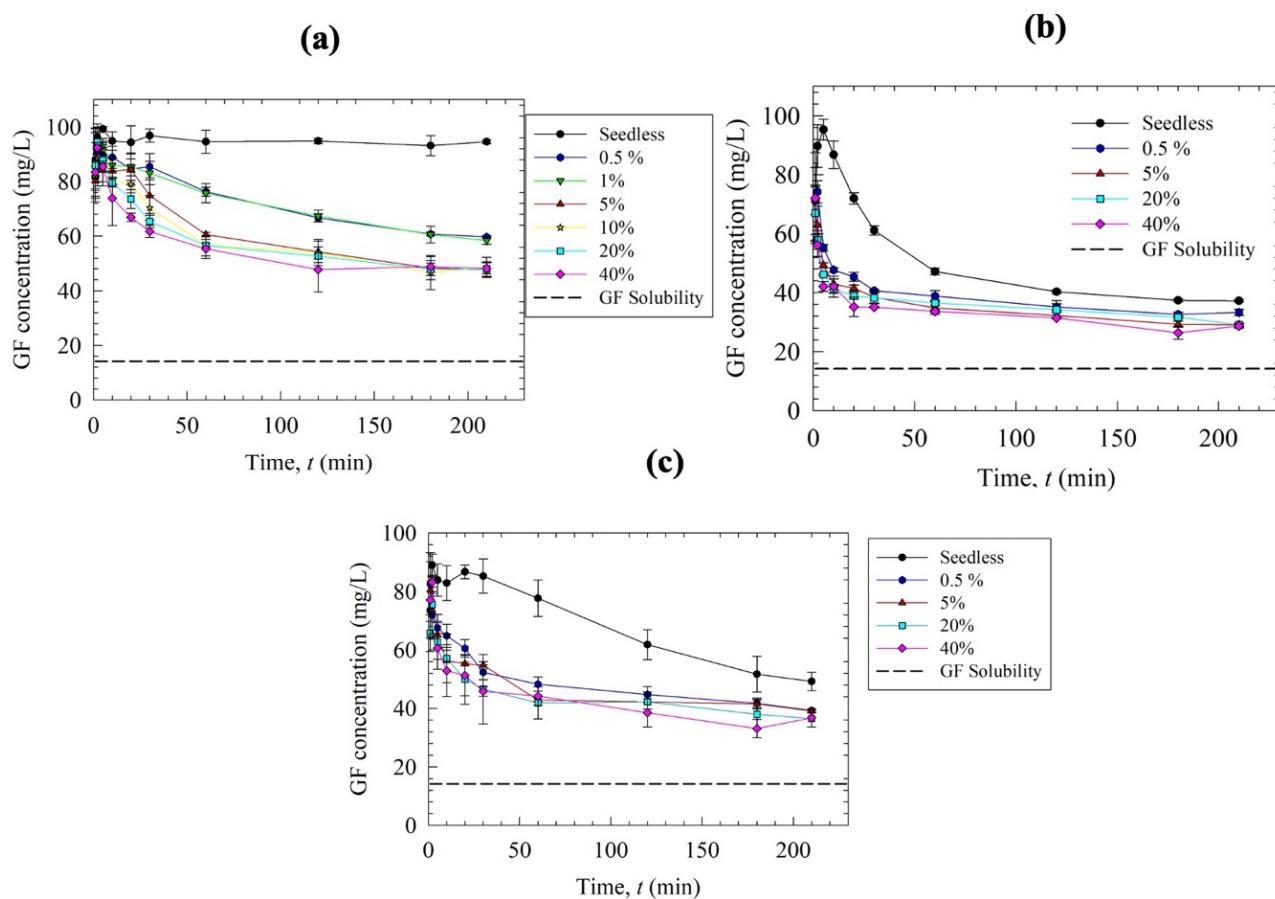

Figure S1. Effects of seed loading on the desupersaturation in the solvent-shift test when a 20 mL GF–acetone solution was mixed with 1000 mL aqueous solutions of SDS and various polymers: (a) Sol, (b) VA64, and (c) HPMC. Nanoseeds were added to the supersaturated solution at the weight percentages indicated.

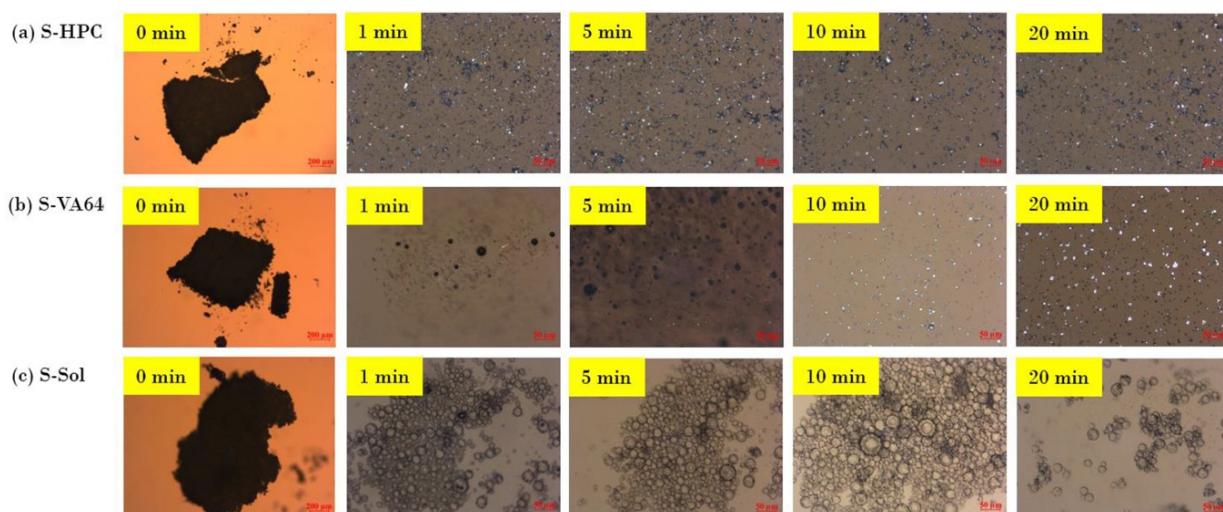

Figure S2. PLM images of a loose compact of the spray-dried ASD particles with 1:3 drug:polymer mass ratio in 40 μ L deionized water: (a) S-HPC, (b) S-VA64, and (c) S-Sol, respectively. 20 μ L deionized water was added initially and rest of the 20 μ L water was added after 10 min. The images were taken at 0 (before adding water), 1, 5, 10, and 20 min after the addition of deionized water. Except 0 min image (5X magnification, scale bar: 200 μ m), which focused on the compact, all other images focused on particles that emanated from the surface, which were captured at 20X magnification (scale bar: 50 μ m).
