CDR3 Variants of the TxB2 Shuttle with Increased TfR1 Association Rate and Enhanced Brain Penetration

Pawel Stocki ^{1,†}, Jaroslaw Szary ^{1,†}, Mykhaylo Demydchuk ¹, Leandra Northall ¹, Charlotte L. M. Rasmussen ², Diana Bahu Logan ¹, Aziz Gauhar ¹, Laura Thei ¹, Shu-Fen Coker ¹, Torben Moos ², Frank S. Walsh ¹ and J. Lynn Rutkowski ^{1,*}

Supplementary Figure S1. IHC assessment of choroid plexus. (a) The untreated control was obtained from non-injected animals and served as a staining control. Mice were dosed with either (b) the negative control VNAR-hFc (neg. cont.), (c) TxB4, (d) PD-L1 antibody or (e) TxB4-PD-L1 at 25 nmol/kg, IV and brains were collected following cardiac perfusion 18 hrs post injection ($n = 2$). Brain sections were analyzed for the presence of exogenous antibodies by IHC and images were collected from choroid plexus for comparison. Scale bars at 500 μ m.
