## This file includes:

### (1) Supplementary figures

- Figure S1. FTIR images of AuNPs before and after modification.

### (2) Supplementary tables

- Table S1. Original data for standard curve of SEB ALISA.
- Table S2. Original data for intraassay of SEB ALISA (n = 8).
- Table S3. Original data for inter-assay of SEB ALISA (n = 8).
- Table S4. Recovery data in Dilution Buffer of SEB ALISA.
- Table S5. Recoveries data of SEB detection by ALISA in various matrices.

## Supplementary figures

**Figure S1.** FTIR images of AuNPs before and after modification

Before PEG modification, the surface of gold nanoparticles was coated with sodium citrate, so that AuNPs surface showed a broad and blunt O-H stretching vibration absorption peak at  $3413\text{ cm}^{-1}$ . When PEG is modified on the surface, the asymmetric and symmetric stretching vibration peaks of C-H ( $\nu_{\text{asC-H}} 2915\text{ cm}^{-1}$  and  $\nu_{\text{SC-H}} 2869\text{ cm}^{-1}$ ) will appear due to the structure of PEG, as shown in the FigS1. Finally, an amide bond is formed when the carboxyl modified gold nanoparticles are cross-linked with the antibody. In the infrared absorption spectrum, N-H stretching vibration peak ( $\nu_{\text{N-H}}$ ) appears near  $3215\text{ cm}^{-1}$ . This peak can be clearly distinguished from the O-H stretching vibration peak. Therefore, the above characterization indicated that the antibody was successfully labeled to the gold nanoparticles.

## Supplementary tables

**Table S1.** Original data for standard curve of SEB ALISA.

Size (nm)	SEB concentration (pg/ mL)	Au concentration (ng/ mL)	Au concentration (ng/ mL)	Au concentration (ng/ mL)
