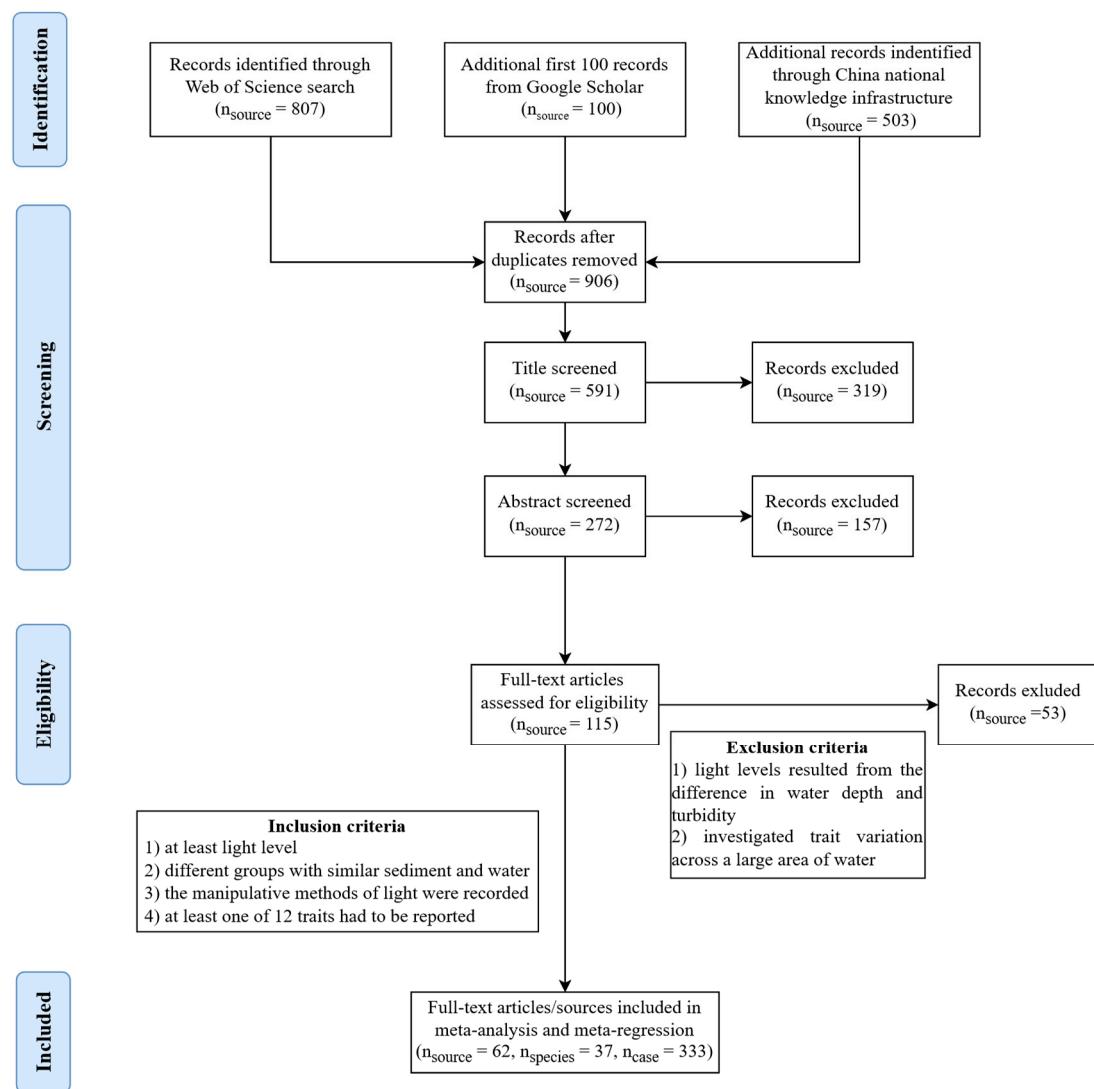

Figure S1 PRISMA flow chart showing the process of selecting publications.

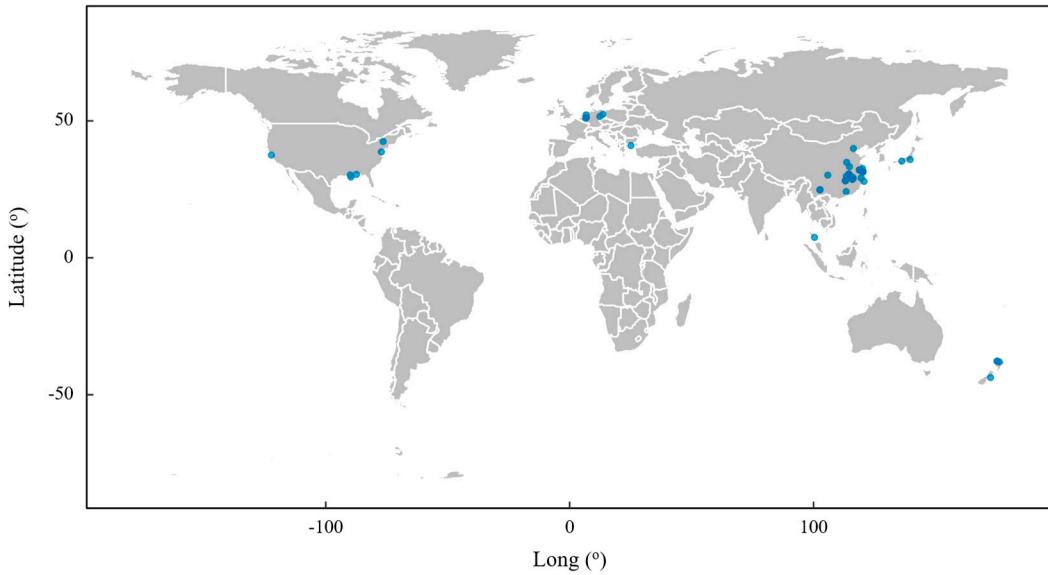

Figure S2 Geographical distribution of sampling sites of submerged plants in the study cases included in the meta-analysis.

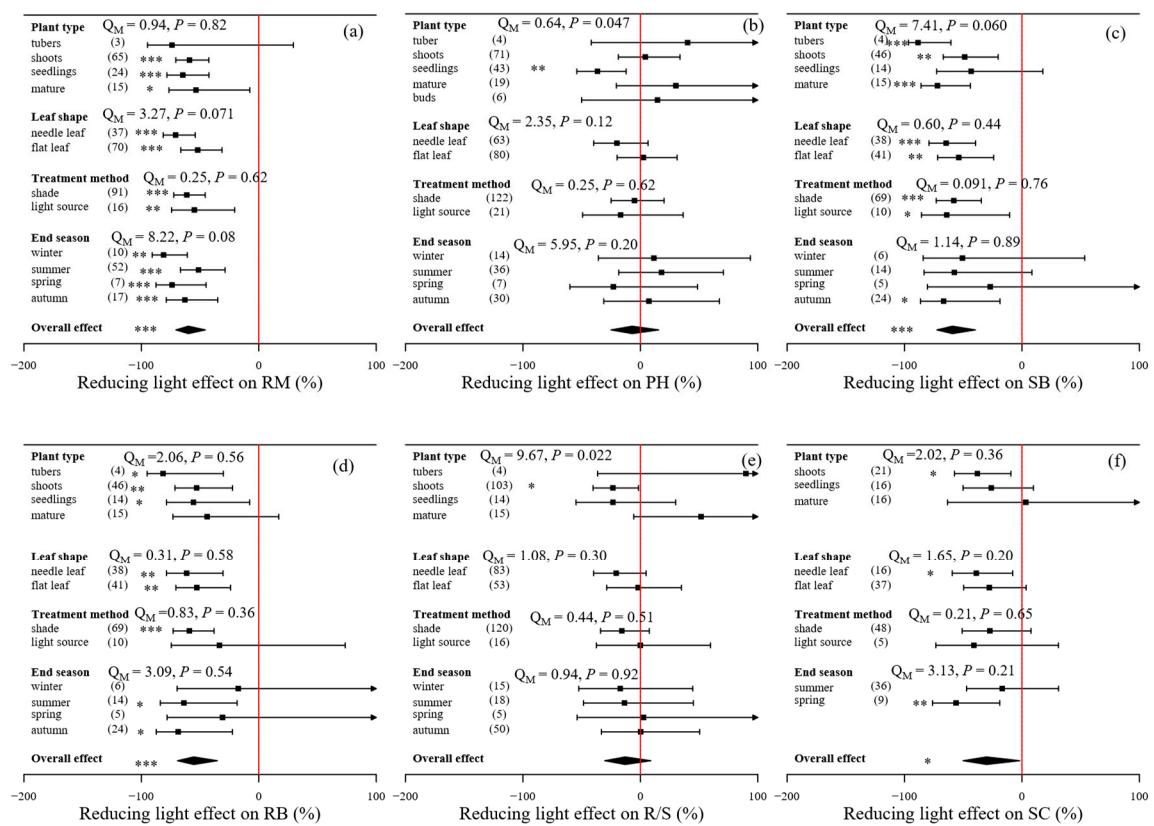

Figure S3 Meta-analysis of the effects of light reduction on the whole-plant traits across different moderators. RM: ramet number, PH: plant height, SB: shoot biomass, RB: root biomass, R/S: root-to-shoot ratio, SC: soluble carbohydrates. Overall effect and 95% confidence intervals of light reduction on each trait are given. Where the zero line (red solid line) is not crossed by the confidence intervals, the effect of light reduction was significant (shown by the asterisks, \*  $P < 0.05$ , \*\*  $P < 0.01$ , \*\*\*  $P < 0.001$ ). Arrows indicate 95% confidence intervals extending beyond the limits of the plot. Values in parentheses are sample sizes. The effects of moderators are tested by  $Q_M$  at the 0.05 level.

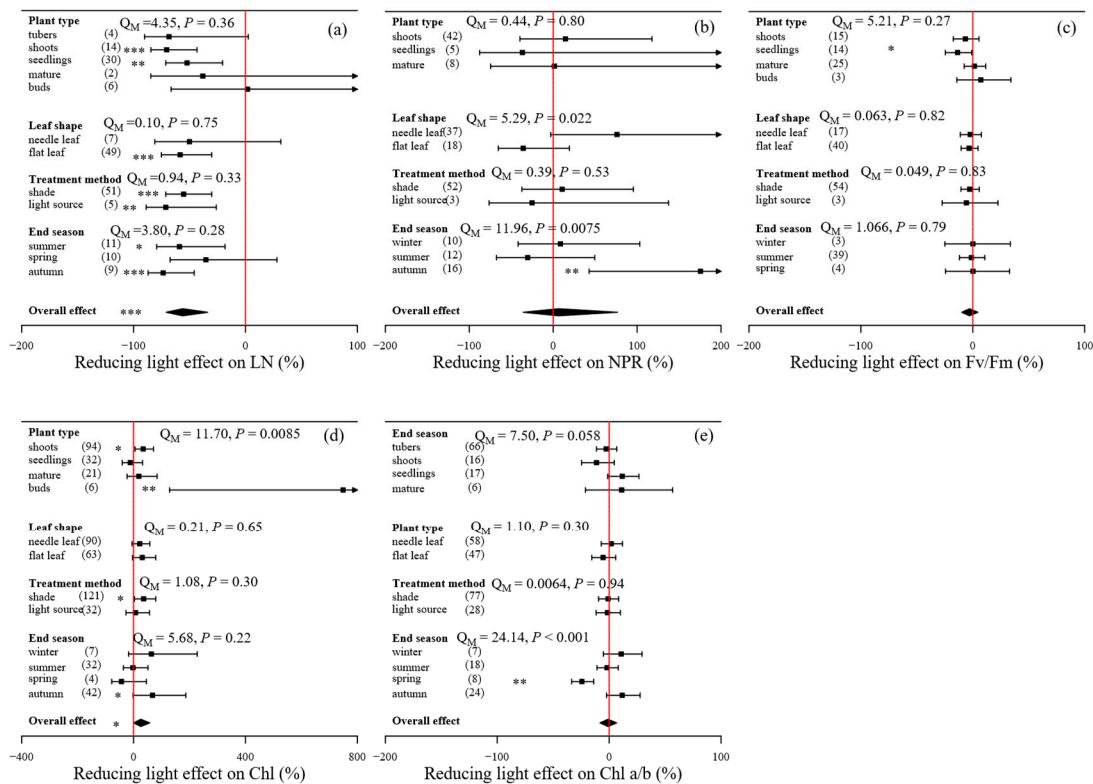

Figure S4 Meta-analysis of the effects of light reduction on the leaf traits across different moderators. LN: leaf number, NPR: net photosynthesis rate, Fv/Fm:

leaf maximal quantum yield of photosystem II complex, Chl: chlorophyll content, Chl a/b: chlorophyll a/b ratio. Overall effect and 95% confidence intervals of light reduction on each trait are given. Where the zero line (red solid line) is not crossed by the confidence intervals, the effect of light reduction was significant (shown by the asterisks, \*  $P < 0.05$ , \*\*  $P < 0.01$ , \*\*\*  $P < 0.001$ ). Arrows indicate 95% confidence intervals extending beyond the limits of the plot. Values in parentheses are sample sizes. The effects of moderators are tested by  $Q_M$  at the 0.05 level.

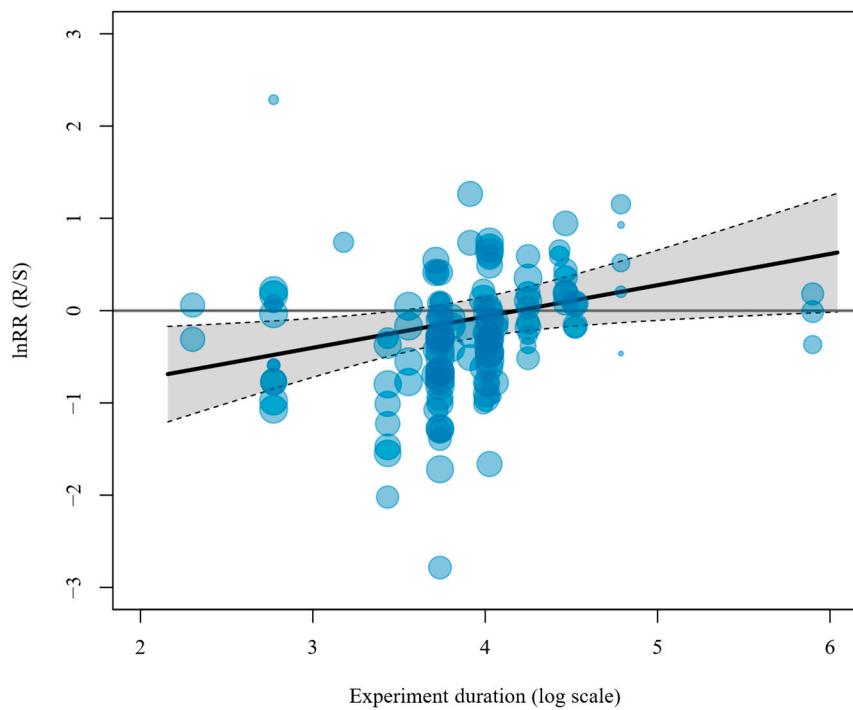

Figure S5 Relationship of lnRRs of submerged macrophytes root-to-shoot ratio (R/S) with the experimental period (log scale) in the meta-analysis.

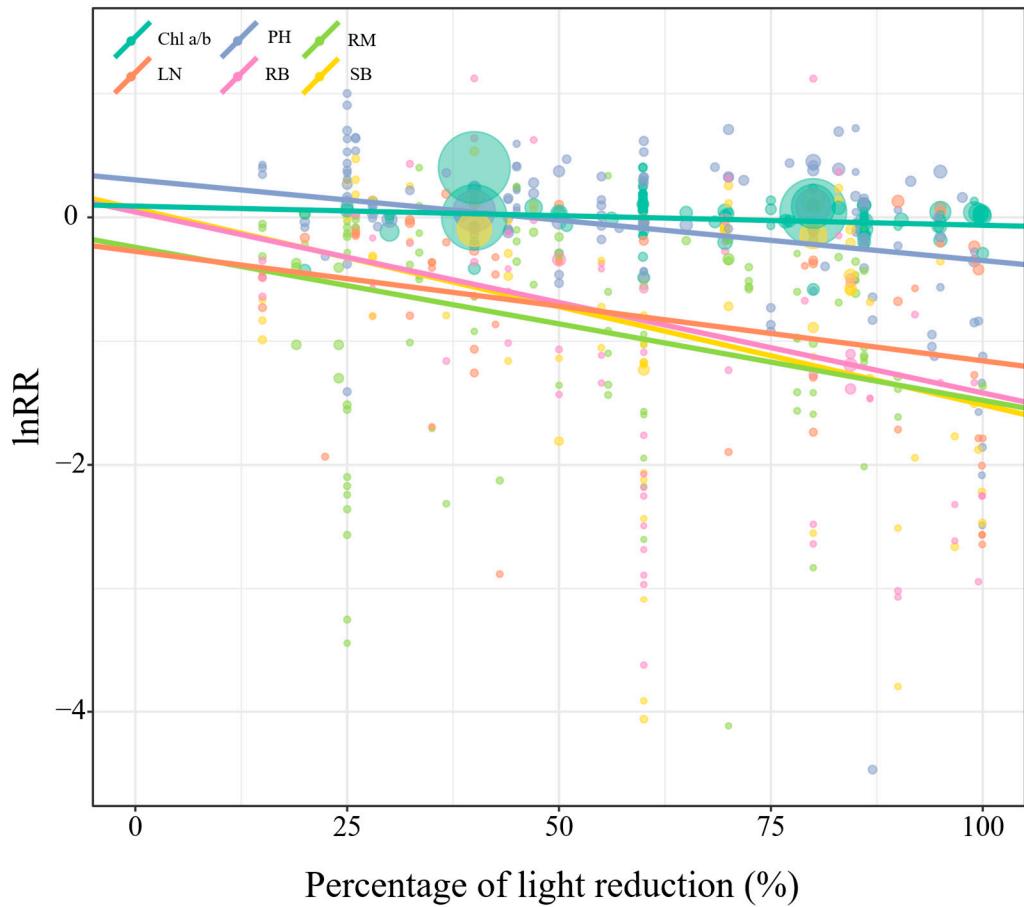

Figure S6 Relationships of lnRRs of submerged macrophytes traits with the percentage of light reduction in the meta-analysis. RM: ramet number, PH: plant height, SB: shoot biomass, RB: root biomass, LN: leaf number, Chl a/b: chlorophyll a/b ratio.

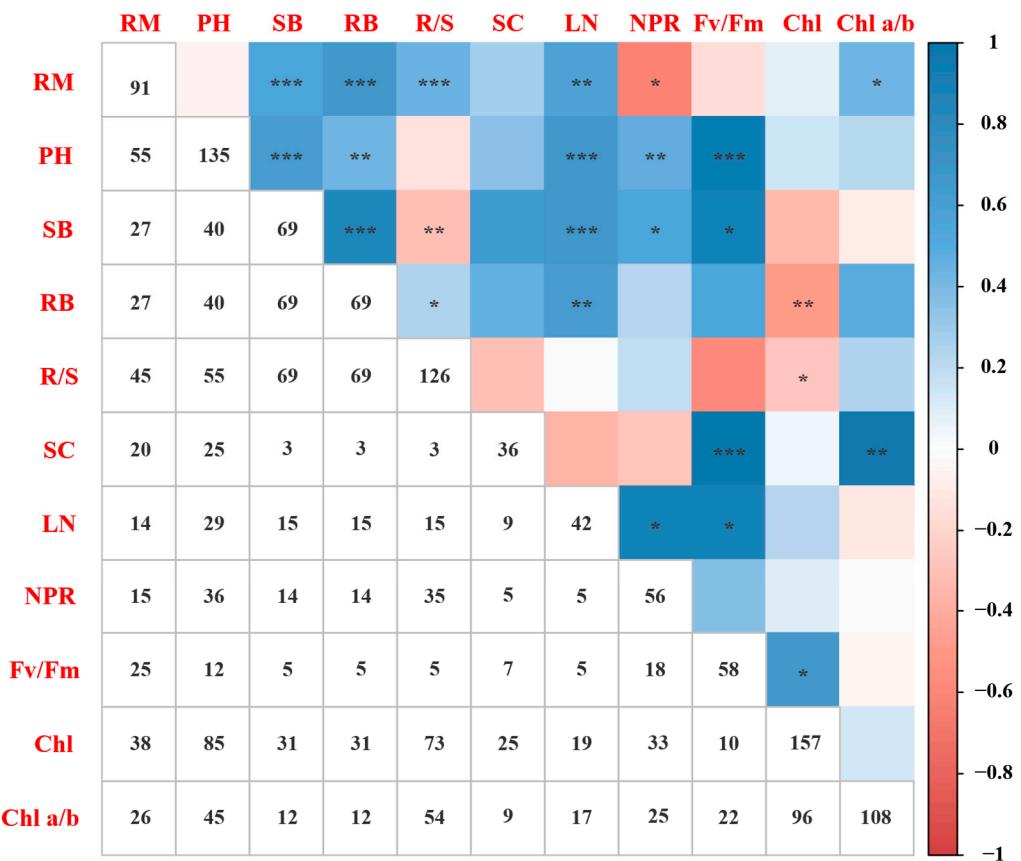

Figure S7 Heatmap of the Pearson's correlation coefficients between lnRRs of the paired whole-plants and leaf traits in the meta-analysis. The top-right of the matrix indicates the strength and direction of the correlation, and the bottom-left of the matrix indicates the number of observations (colors corresponding to the correlations). Significant level: \* $P < .05$ , \*\* $P < .01$ , \*\*\* $P < .001$ . RM: ramet number PH: plant height, R/S: root-to-shoot ratio, SB: shoot biomass, RB: root biomass, SC: soluble carbohydrates, LN: leaf number, NPR: net photosynthesis rate, Fv/Fm: leaf maximal quantum yield of photosystem II complex, Chl: chlorophyll content, Chl a/b: chlorophyll a/b ratio.

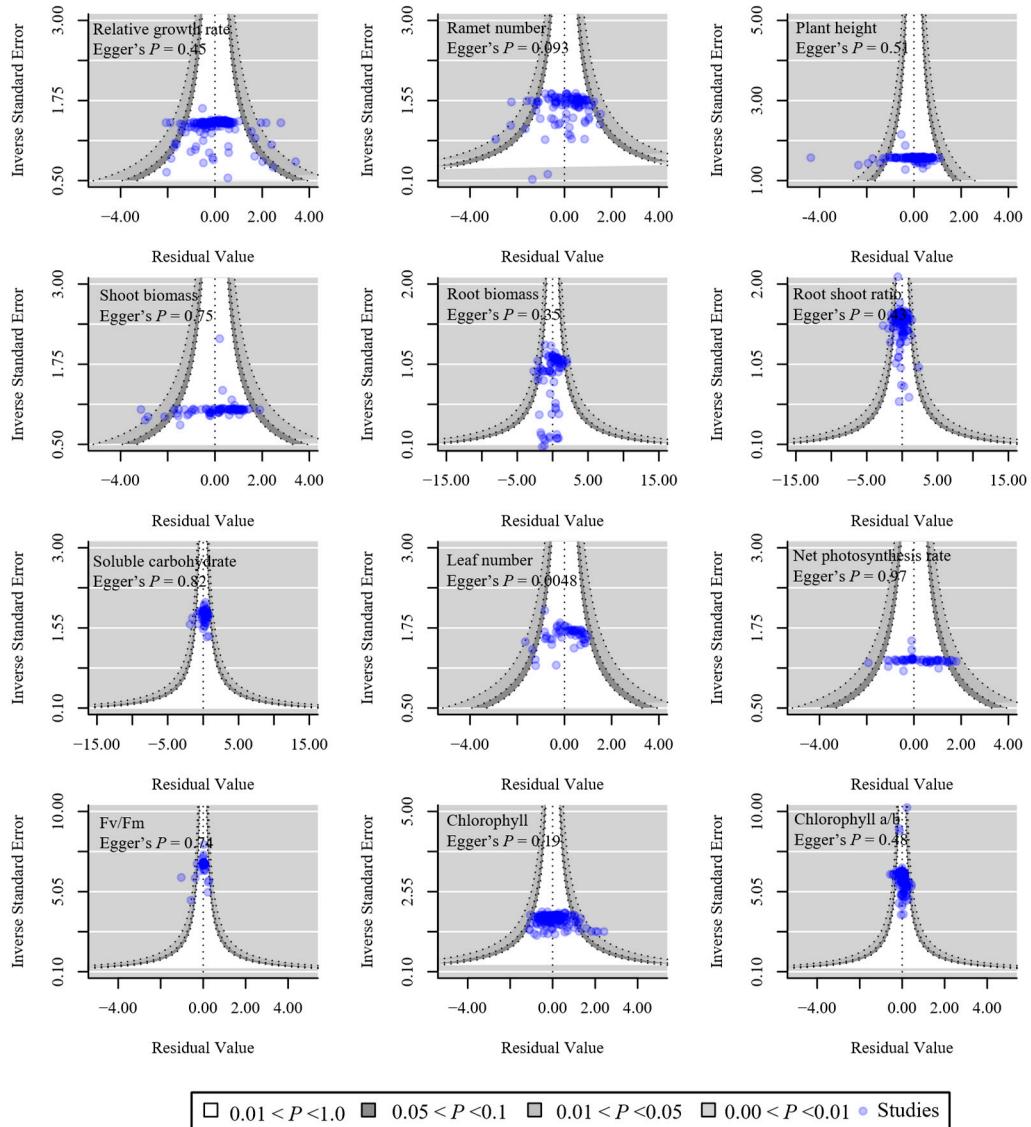

Figure S8 Contour-enhanced funnel plots for null-model residuals and  $P$  value of the Egger's test for lnRR of each variable. Shading colors in each plot represent the significance levels of the residual estimates. Funnel plot symmetry is detected by the Egger's test at 0.05 level.

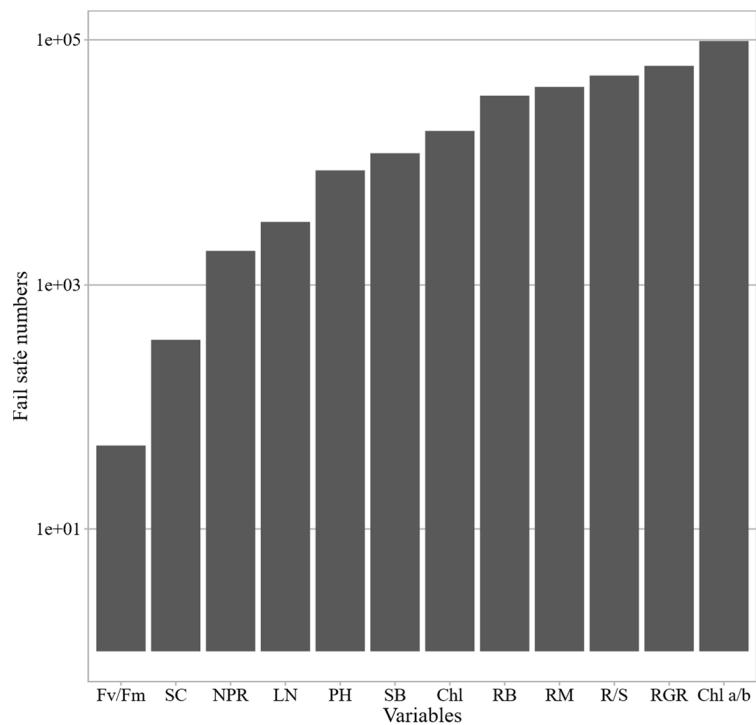

Figure S9 Bar plots of fail-safe numbers of each variable.
