**Supplementary Table S1: PRISMA NMA Checklist of Items to Include When Reporting A Systematic Review Involving a Network Meta-analysis**

Section/Topic	Item #	Checklist Item	Reported on Page #
<b>TITLE</b>			
Title	1	Identify the report as a systematic review <i>incorporating a network meta-analysis (or related form of meta-analysis)</i> .	<b>1</b>
<b>ABSTRACT</b>			
Structured summary	2	Provide a structured summary including, as applicable: <b>Background:</b> main objectives <b>Methods:</b> data sources; study eligibility criteria, participants, and interventions; study appraisal; and <i>synthesis methods, such as network meta-analysis</i> . <b>Results:</b> number of studies and participants identified; summary estimates with corresponding confidence/credible intervals; <i>treatment rankings may also be discussed. Authors may choose to summarize pairwise comparisons against a chosen treatment included in their analyses for brevity.</i> <b>Discussion/Conclusions:</b> limitations; conclusions and implications of findings. <b>Other:</b> primary source of funding; systematic review registration number with registry name.	1
<b>INTRODUCTION</b>			
Rationale	3	Describe the rationale for the review in the context of what is already known, <i>including mention of why a network meta-analysis has been conducted</i> .	<b>1-2</b>
Objectives	4	Provide an explicit statement of questions being addressed, with reference to participants, interventions, comparisons, outcomes, and study design (PICOS).	2
<b>METHODS</b>			
Protocol and registration	5	Indicate whether a review protocol exists and if and where it can be accessed (e.g., Web address); and, if available, provide registration information, including registration number.	PROSPERO CRD42019129839
Eligibility criteria	6	Specify study characteristics (e.g., PICOS, length of follow-up) and report characteristics (e.g., years considered, language, publication status) used as criteria for eligibility, giving rationale. <i>Clearly describe eligible treatments included in the treatment network, and note whether any</i>	<b>4</b>

		<i>have been clustered or merged into the same node (with justification).</i>	
Information sources	7	Describe all information sources (e.g., databases with dates of coverage, contact with study authors to identify additional studies) in the search and date last searched.	3
Search	8	Present full electronic search strategy for at least one database, including any limits used, such that it could be repeated.	Supplementary Document S1
Study selection	9	State the process for selecting studies (i.e., screening, eligibility, included in systematic review, and, if applicable, included in the meta-analysis).	4
Data collection process	10	Describe method of data extraction from reports (e.g., piloted forms, independently, in duplicate) and any processes for obtaining and confirming data from investigators.	4
Data items	11	List and define all variables for which data were sought (e.g., PICOS, funding sources) and any assumptions and simplifications made.	4
<b>Geometry of the network</b>	<b>S1</b>	Describe methods used to explore the geometry of the treatment network under study and potential biases related to it. This should include how the evidence base has been graphically summarized for presentation, and what characteristics were compiled and used to describe the evidence base to readers.	<b>6-7</b>
Risk of bias within individual studies	12	Describe methods used for assessing risk of bias of individual studies (including specification of whether this was done at the study or outcome level), and how this information is to be used in any data synthesis.	4-5
Summary measures	13	State the principal summary measures (e.g., risk ratio, difference in means). <i>Also describe the use of additional summary measures assessed, such as treatment rankings and surface under the cumulative ranking curve (SUCRA) values, as well as modified approaches used to present summary findings from meta-analyses.</i>	5
Planned methods of analysis	14	Describe the methods of handling data and combining results of studies for each network meta-analysis. This should include, but not be limited to: <ul style="list-style-type: none"> <li>• <i>Handling of multi-arm trials;</i></li> <li>• <i>Selection of variance structure;</i></li> <li>• <i>Selection of prior distributions in Bayesian analyses; and</i></li> <li>• <i>Assessment of model fit.</i></li> </ul>	4-6
<b>Assessment of Inconsistency</b>	<b>S2</b>	Describe the statistical methods used to evaluate the agreement of direct and indirect evidence in the treatment network(s) studied. Describe efforts taken to address its presence when found.	5

Risk of bias across studies	15	Specify any assessment of risk of bias that may affect the cumulative evidence (e.g., publication bias, selective reporting within studies).	4-5
Additional analyses	16	Describe methods of additional analyses if done, indicating which were pre-specified. This may include, but not be limited to, the following: <ul style="list-style-type: none"> <li>• Sensitivity or subgroup analyses;</li> <li>• Meta-regression analyses;</li> <li>• <i>Alternative formulations of the treatment network; and</i></li> <li>• <i>Use of alternative prior distributions for Bayesian analyses (if applicable).</i></li> </ul>	5-6
<b>RESULTS†</b>			
Study selection	17	Give numbers of studies screened, assessed for eligibility, and included in the review, with reasons for exclusions at each stage, ideally with a flow diagram.	6 Figure 1
<b>Presentation of network structure</b>	<b>S3</b>	Provide a network graph of the included studies to enable visualization of the geometry of the treatment network.	<b>Figure 2</b> <b>Supplementary Figures S1-S3, 6-7</b>
<b>Summary of network geometry</b>	<b>S4</b>	Provide a brief overview of characteristics of the treatment network. This may include commentary on the abundance of trials and randomized patients for the different interventions and pairwise comparisons in the network, gaps of evidence in the treatment network, and potential biases reflected by the network structure.	
Study characteristics	18	For each study, present characteristics for which data were extracted (e.g., study size, PICOS, follow-up period) and provide the citations.	Supplementary Table S2 Supplementary Table S3
Risk of bias within studies	19	Present data on risk of bias of each study and, if available, any outcome level assessment.	6 Supplementary Table S4
Results of individual studies	20	For all outcomes considered (benefits or harms), present, for each study: 1) simple summary data for each intervention group, and 2) effect estimates and confidence intervals. <i>Modified approaches may be needed to deal with information from larger networks.</i>	Supplementary Table S3
Synthesis of results	21	Present results of each meta-analysis done, including confidence/credible intervals. <i>In larger networks, authors may focus on comparisons versus a particular comparator (e.g. placebo or standard care), with full findings presented in an appendix. League tables and forest plots may be considered to summarize pairwise comparisons. If additional summary measures were explored</i>	<b>6-7, 10-11</b> <b>Table 1, Table 2</b> <b>Supplementary Tables S5-S14</b>

		(such as treatment rankings), these should also be presented.	
<b>Exploration for inconsistency</b>	<b>S5</b>	Describe results from investigations of inconsistency. This may include such information as measures of model fit to compare consistency and inconsistency models, <i>P</i> values from statistical tests, or summary of inconsistency estimates from different parts of the treatment network.	<b>11</b>  <i>Supplementary Tables S15-S35</i>
Risk of bias across studies	22	Present results of any assessment of risk of bias across studies for the evidence base being studied.	11 Supplementary Tables S52-S56
Results of additional analyses	23	Give results of additional analyses, if done (e.g., sensitivity or subgroup analyses, meta-regression analyses, <i>alternative network geometries studied, alternative choice of prior distributions for Bayesian analyses</i> , and so forth).	<b>11-12</b>  <i>Supplementary Tables S36-S62</i> <i>Supplementary Figures S37-S39</i> <i>Supplementary Table S68</i>
<b>DISCUSSION</b>			
Summary of evidence	24	Summarize the main findings, including the strength of evidence for each main outcome; consider their relevance to key groups (e.g., healthcare providers, users, and policy-makers).	13-14
Limitations	25	Discuss limitations at study and outcome level (e.g., risk of bias), and at review level (e.g., incomplete retrieval of identified research, reporting bias). <i>Comment on the validity of the assumptions, such as transitivity and consistency. Comment on any concerns regarding network geometry (e.g., avoidance of certain comparisons).</i>	14-15
Conclusions	26	Provide a general interpretation of the results in the context of other evidence, and implications for future research.	15
<b>FUNDING</b>			17
Funding	27	Describe sources of funding for the systematic review and other support (e.g., supply of data); role of funders for the systematic review. This should also include information regarding whether funding has been received from manufacturers of treatments in the network and/or whether some of the authors are content experts with professional conflicts of interest that could affect use of treatments in the network.	

PICOS = population, intervention, comparators, outcomes, study design.

\* Text in italics indicates wording specific to reporting of network meta-analyses that has been added to guidance from the PRISMA statement.

† Authors may wish to plan for use of appendices to present all relevant information in full detail for items in this section.

**Supplementary Figure S2.** Network diagrams for glycemic control biomarkers illustrating the available direct comparisons between dietary patterns. The size of the nodes is proportional to the sample size of each dietary pattern intervention, and the thickness of the lines is proportional to the number of studies available. The number of studies for each dietary pattern were: a: Glucose: Mediterranean diet (n = 15); Dietary Approaches to Stop Hypertension (n = 2); Paleo diet (n = 2); Dietary guidelines-based diets (n = 12); low GI / GL diet (n = 7); plant-based diets (n = 3); low fat diet (n = 7); low carbohydrate high fat diet (n = 3); traditional Mexican diet (n = 1); high GI / GL diet (n = 7); and western habitual diet (n = 25). b: Insulin: Mediterranean diet (n = 13); Dietary Approaches to Stop Hypertension (n = 2); Paleo diet (n = 2); Dietary guidelines-based diets (n = 9); low GI / GL diet (n = 7); plant-based diets (n = 2); low fat diet (n = 7); low carbohydrate high fat diet (n = 2); high GI / GL diet (n = 7); and western habitual diet (n = 19). c: Homeostatic model assessment for insulin resistance: Mediterranean diet (n = 5); Paleo diet (n = 1); Dietary guidelines-based diets (n = 5); low GI / GL diet (n = 2); plant-based diets (n = 1); low fat diet (n = 4); high GI / GL diet (n = 2); and western habitual diet (n = 9).

*Abbreviations:* CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension; GI/GL glycemic index/glycemic load

a

b

**Supplementary Figure S3.** Network diagrams for inflammatory biomarkers illustrating the available direct comparisons between dietary patterns. The size of the nodes is proportional to the sample size of each dietary pattern intervention, and the thickness of the lines is proportional to the number of studies available. The number of studies for each dietary pattern were: a: high sensitivity C-Reactive Protein: Mediterranean diet (n = 10); Dietary Approaches to Stop Hypertension (n = 1); Paleo diet (n = 2); Dietary guidelines-based diets (n = 12); plant-based diets (n = 3); low fat diet (n = 4); low carbohydrate high fat diet (n = 3); and western habitual diet (n = 18). b: Interleukin-6: Mediterranean diet (n = 3); Paleo diet (n = 1); Dietary guidelines-based diets (n = 3); low fat diet (n = 1); and western habitual diet (n = 4).

*Abbreviations:* CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension; GI/GL glycemic index/glycemic load

The lower and upper edges of the box represent the 25<sup>th</sup> and 75<sup>th</sup> percentiles, the middle line in the box marks the 50<sup>th</sup> percentile (median), the error bars are the 95% confidence intervals, and any dots beyond the error bars are outliers.

**Supplementary Figure S12.** Box plot showing the distribution of intervention duration across the direct comparisons for LDL-c

**A** = Mediterranean diet; **B** = Dietary Approaches to Stop Hypertension; **C** = Paleo diet; **D** = Dietary Guidelines-based diets; **E** = low GI / GL diet; **F** = plant-based diets; **G** = low fat diet; **H** = low carbohydrate high fat diet; **I** = high GI / GL diet; **J** = western habitual diet

The lower and upper edges of the box represent the 25<sup>th</sup> and 75<sup>th</sup> percentiles, the middle line in the box marks the 50th percentile (median), the error bars are the 95% confidence intervals, and any dots beyond the error bars are outliers.

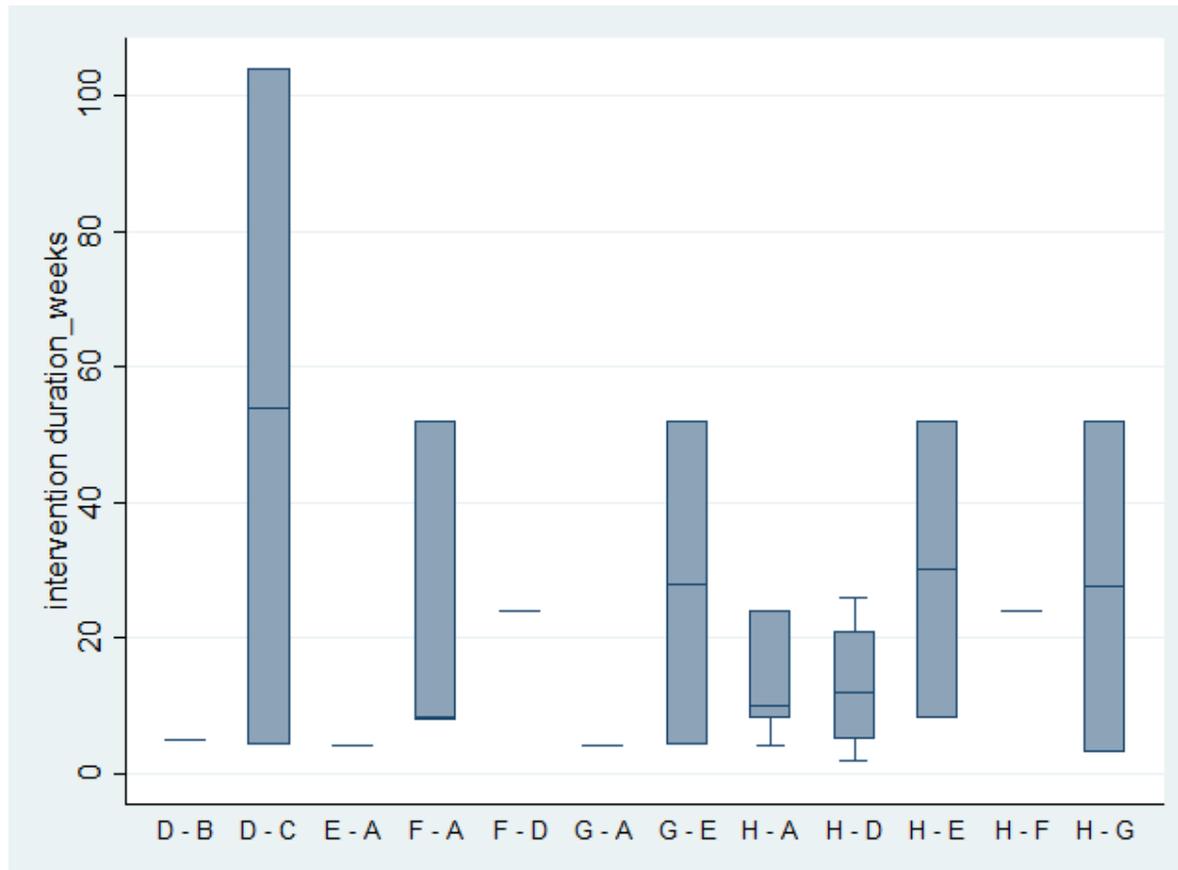

**Supplementary Figure S13.** Box plot showing the distribution of intervention duration across the direct comparisons for glucose

**A** = Mediterranean diet; **B** = Dietary Approaches to Stop Hypertension; **C** = Paleo diet; **D** = Dietary Guidelines-based diets; **E** = low GI / GL diet; **F** = plant-based diets; **G** = low fat diet; **H** = low carbohydrate high fat diet; **I** = traditional Mexican diet; **J** = high GI / GL diet; **K** = western habitual diet

The lower and upper edges of the box represent the 25<sup>th</sup> and 75<sup>th</sup> percentiles, the middle line in the box marks the 50th percentile (median), the error bars are the 95% confidence intervals, and any dots beyond the error bars are outliers.

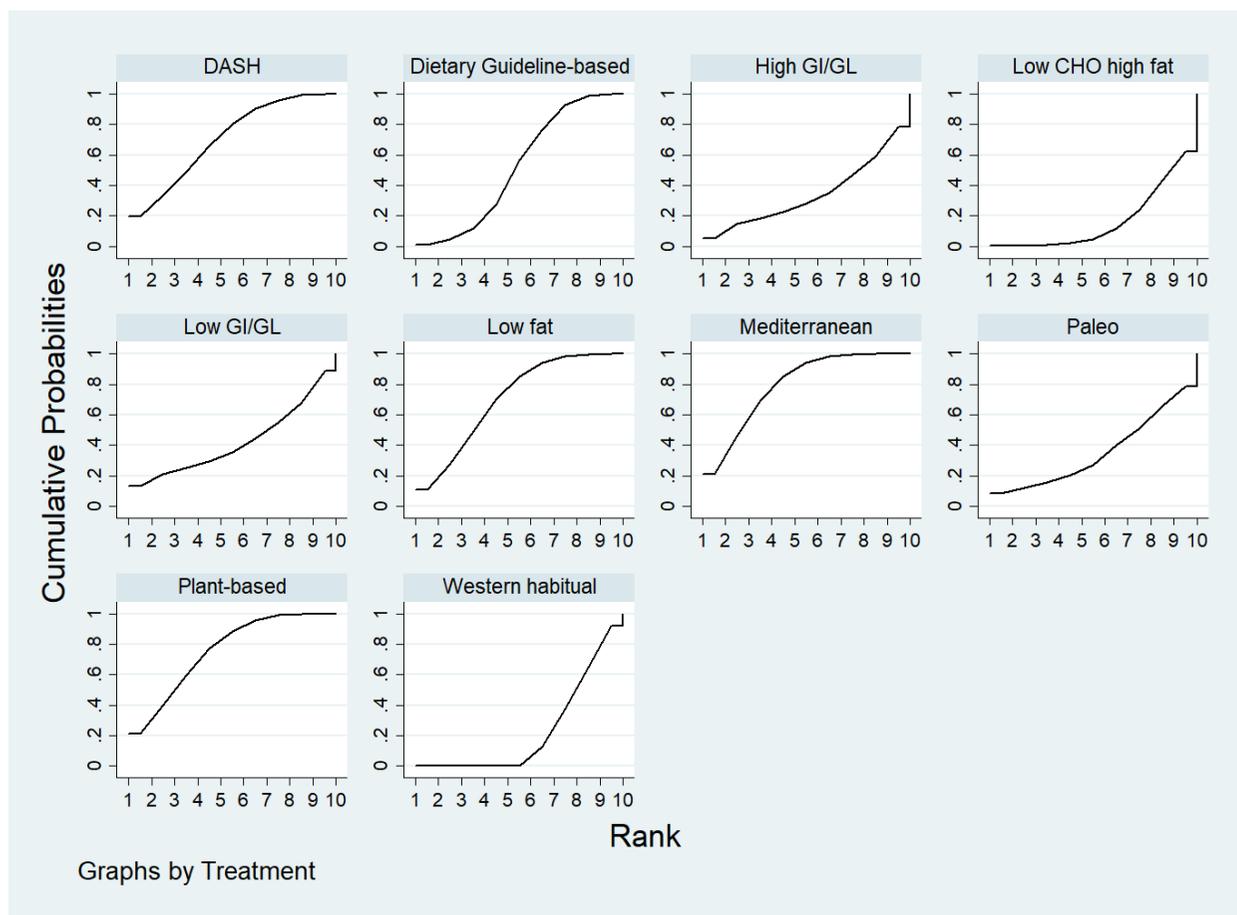

**Supplementary Figure S14.** Box plot showing the distribution of intervention duration across the direct comparisons for hsCRP

**A** = Mediterranean diet; **B** = Dietary Approaches to Stop Hypertension; **C** = Paleo diet; **D** = Dietary Guidelines-based diets; **E** = plant-based diets; **F** = low fat diet; **G** = low carbohydrate high fat diet; **H** = western habitual diet

The lower and upper edges of the box represent the 25<sup>th</sup> and 75<sup>th</sup> percentiles, the middle line in the box marks the 50<sup>th</sup> percentile (median), the error bars are the 95% confidence intervals, and any dots beyond the error bars are outliers.

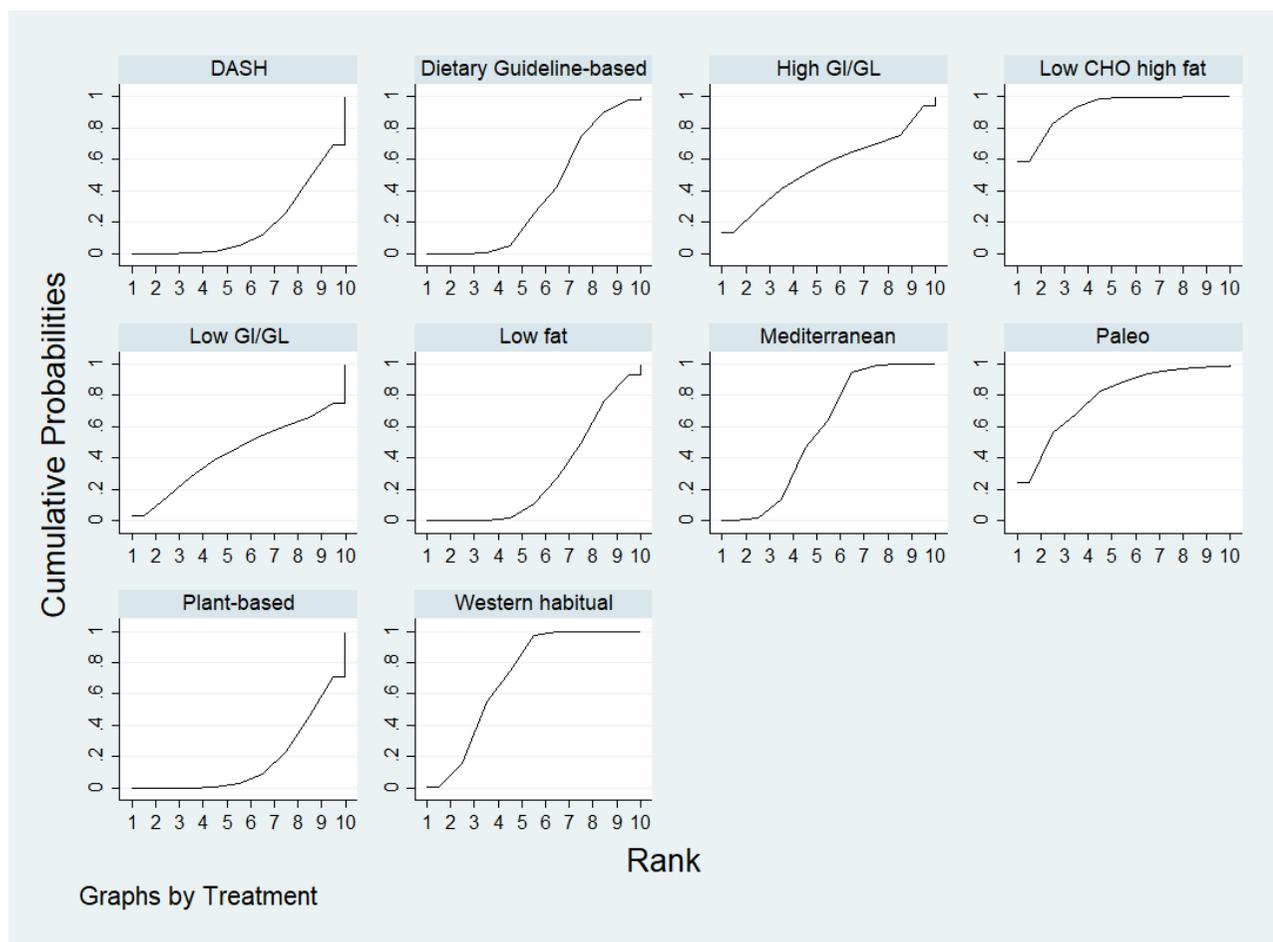

Supplementary Figure S15. Rankograms for LDL-c<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the DASH, low fat, Mediterranean, and plant-based diet indicating uncertainty in their ranking.

*Abbreviations:* CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension; GI/GL, glycemic index/glycemic load

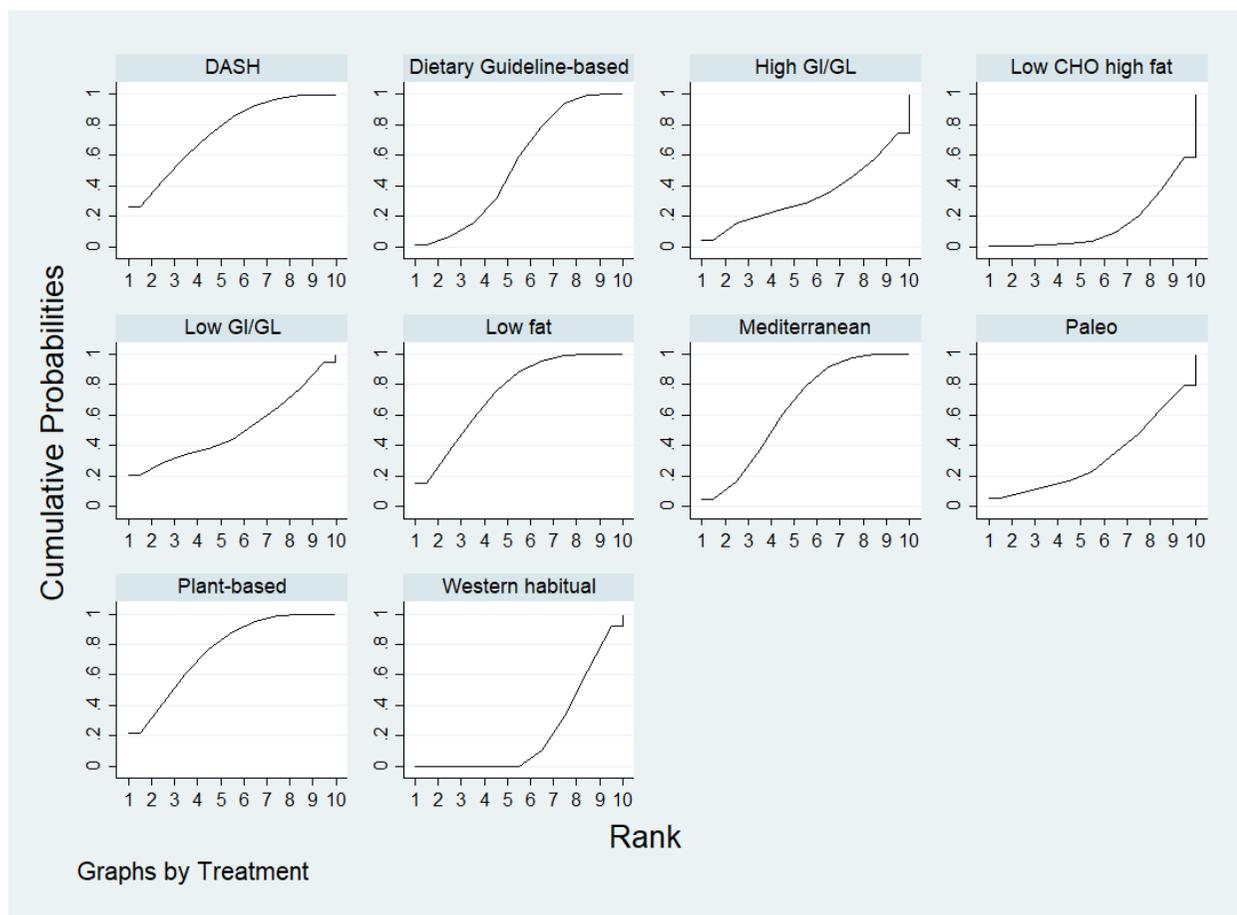

Supplementary Figure S16. Rankograms for HDL-c<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the DASH, dietary guideline-based, low fat, plant-based diet indicating uncertainty in their ranking.

*Abbreviations:* CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension; GI/GL, glycemic index/glycemic load

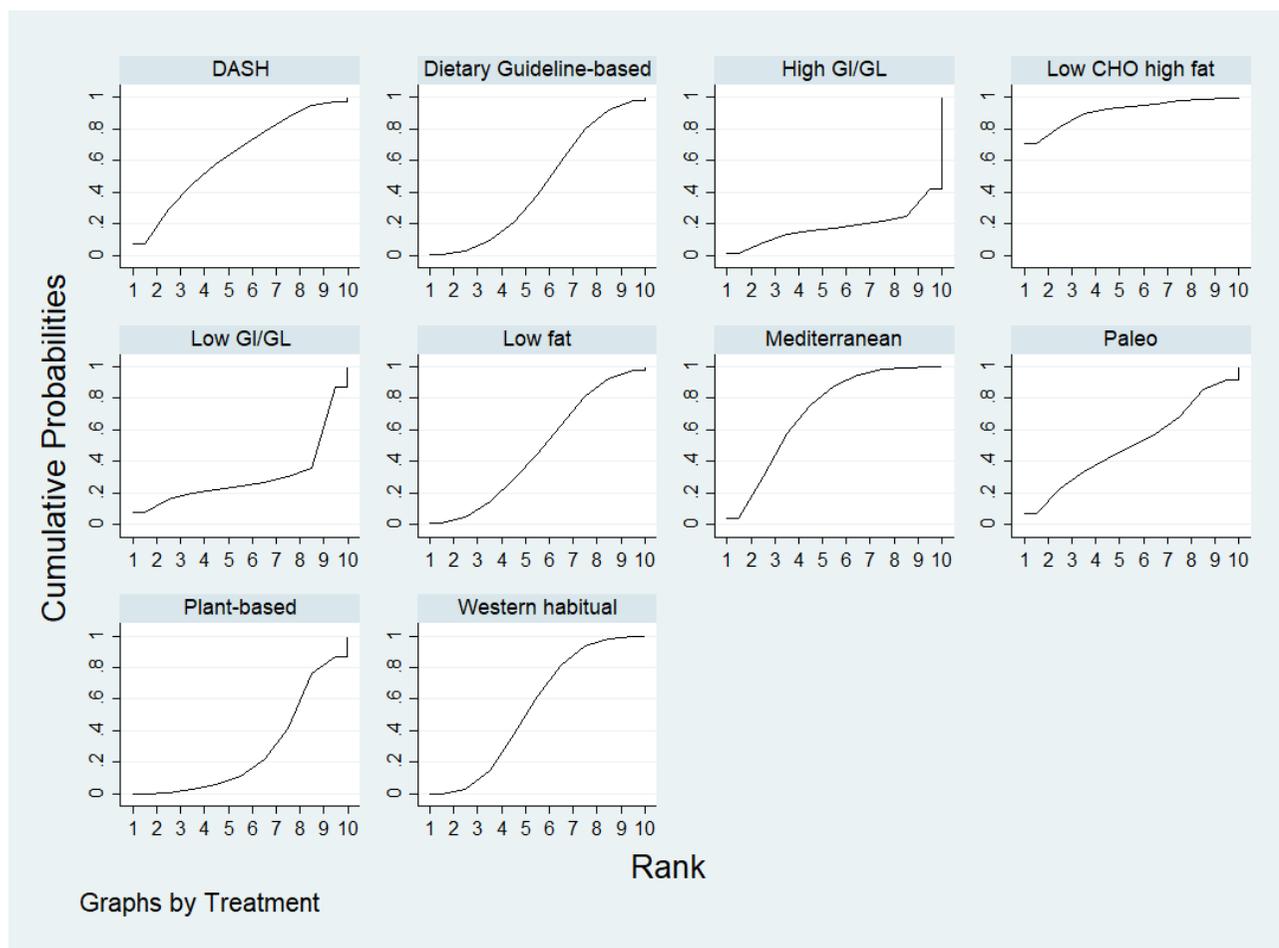

Supplementary Figure S17. Rankograms for total cholesterol<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the DASH, dietary guideline-based, low fat, Mediterranean and plant-based diet indicating uncertainty in their ranking.

Abbreviations: CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension; GI/GL, glycemic index/glycemic load

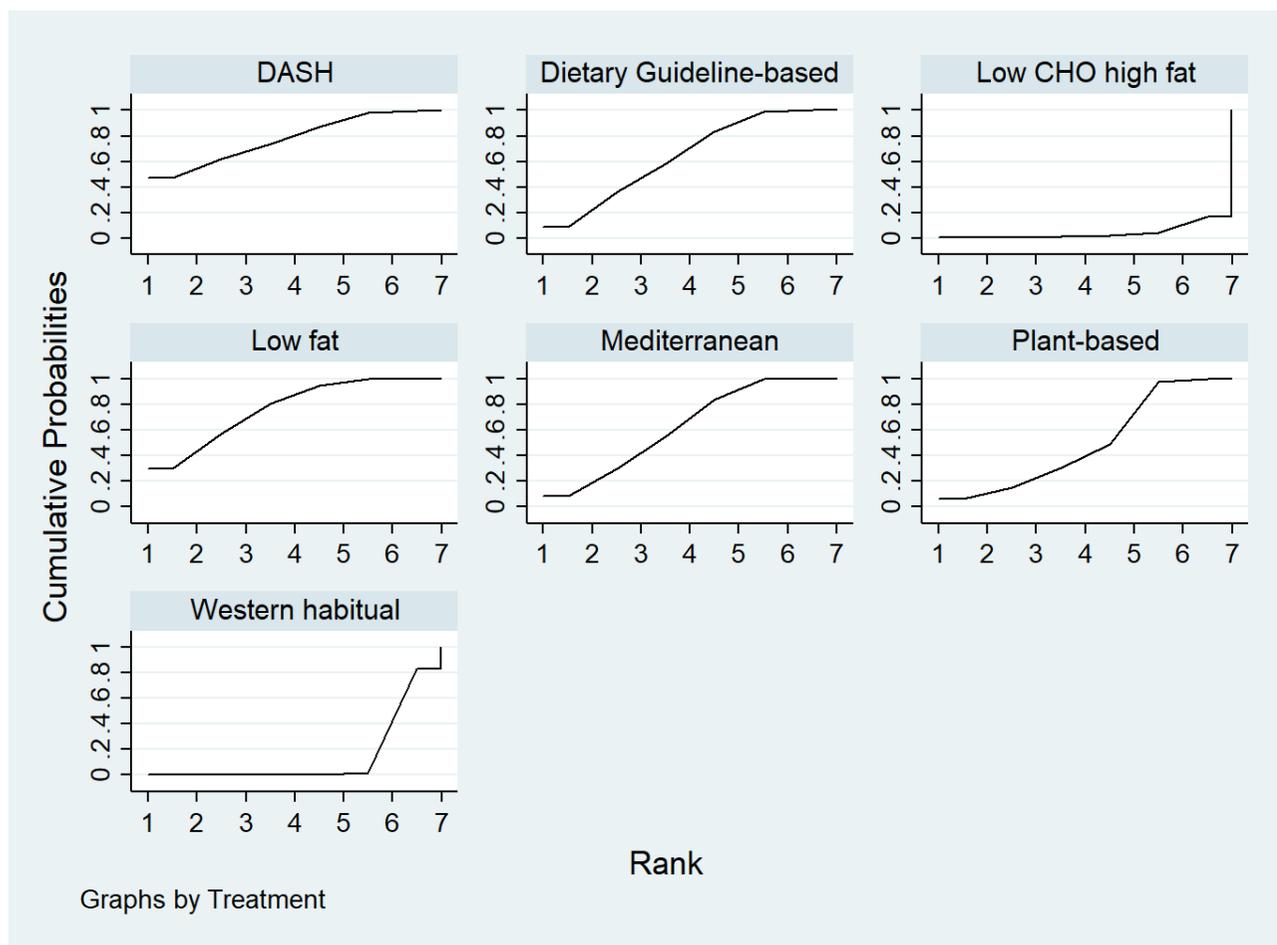

Supplementary Figure S18. Rankograms for triglycerides<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the dietary guideline-based, low fat, and western habitual diet indicating uncertainty in their ranking.

*Abbreviations:* CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension; GI/GL, glycemic index/glycemic load

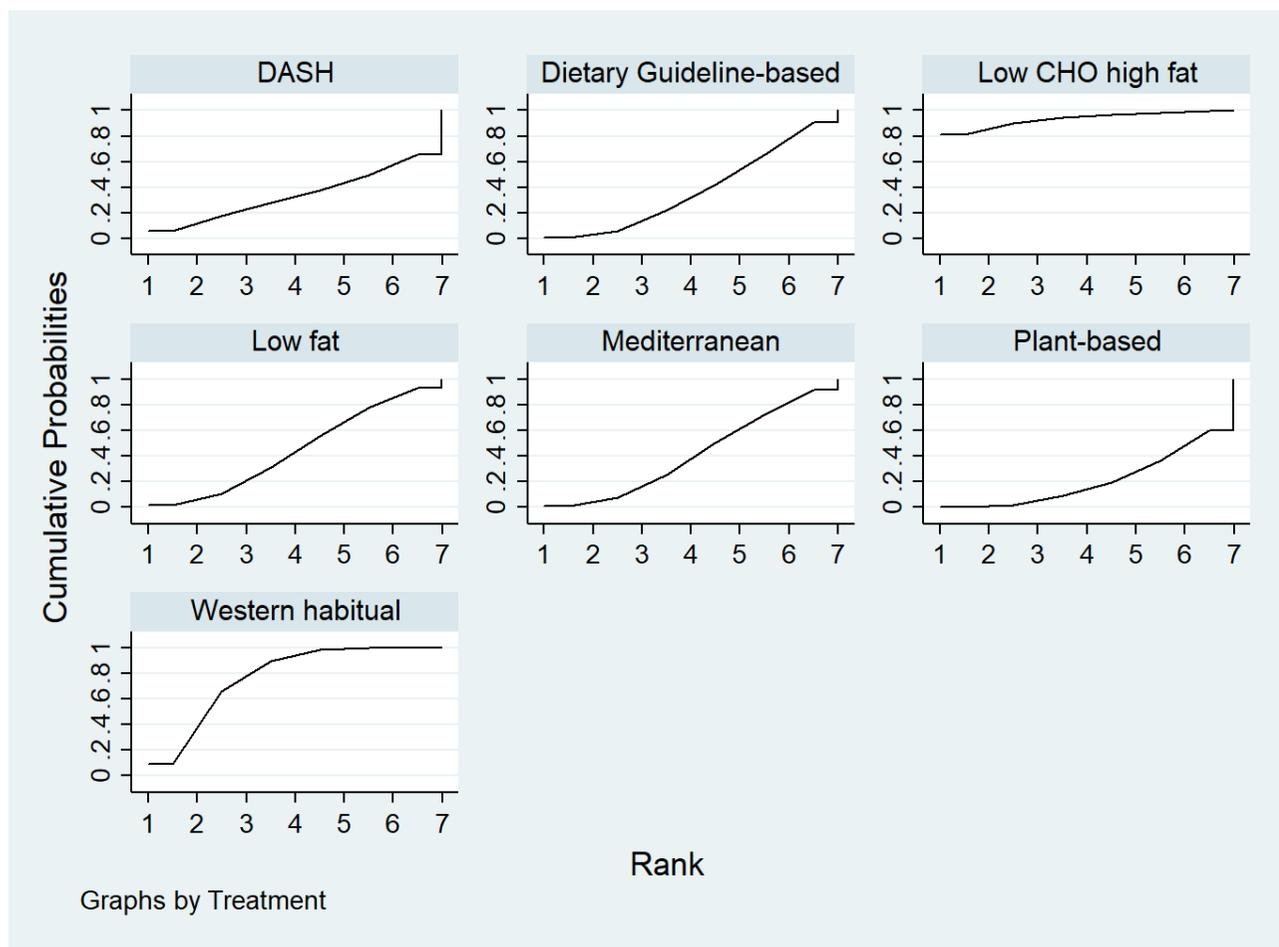

Supplementary Figure S19. Rankograms for ApoB<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the dietary guideline-based and Mediterranean diet indicating uncertainty in their ranking.

Abbreviations: CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension

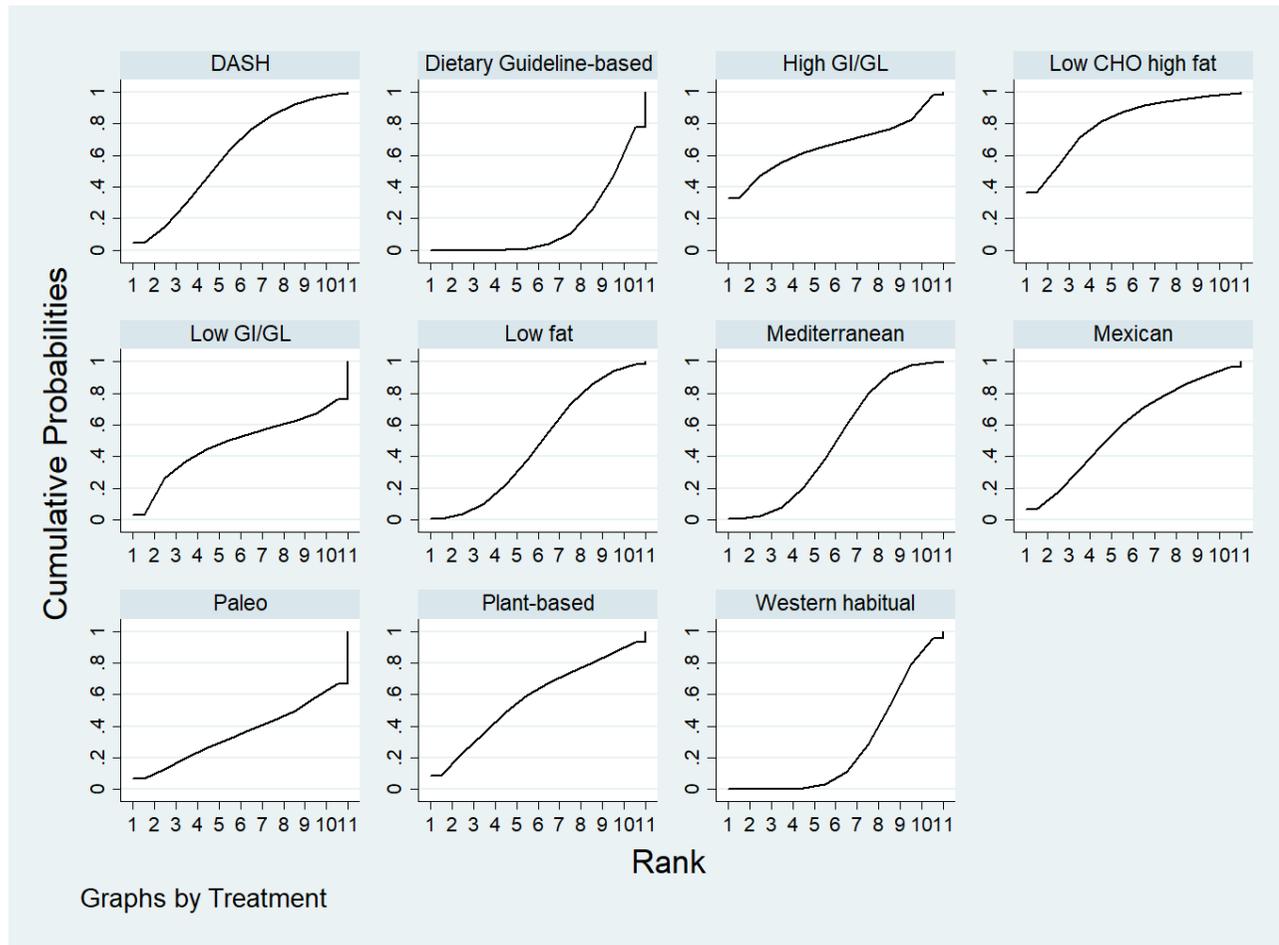

Supplementary Figure S20. Rankograms for ApoA1<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the dietary guideline-based and Mediterranean diet indicating uncertainty in their ranking.

Abbreviations: CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension

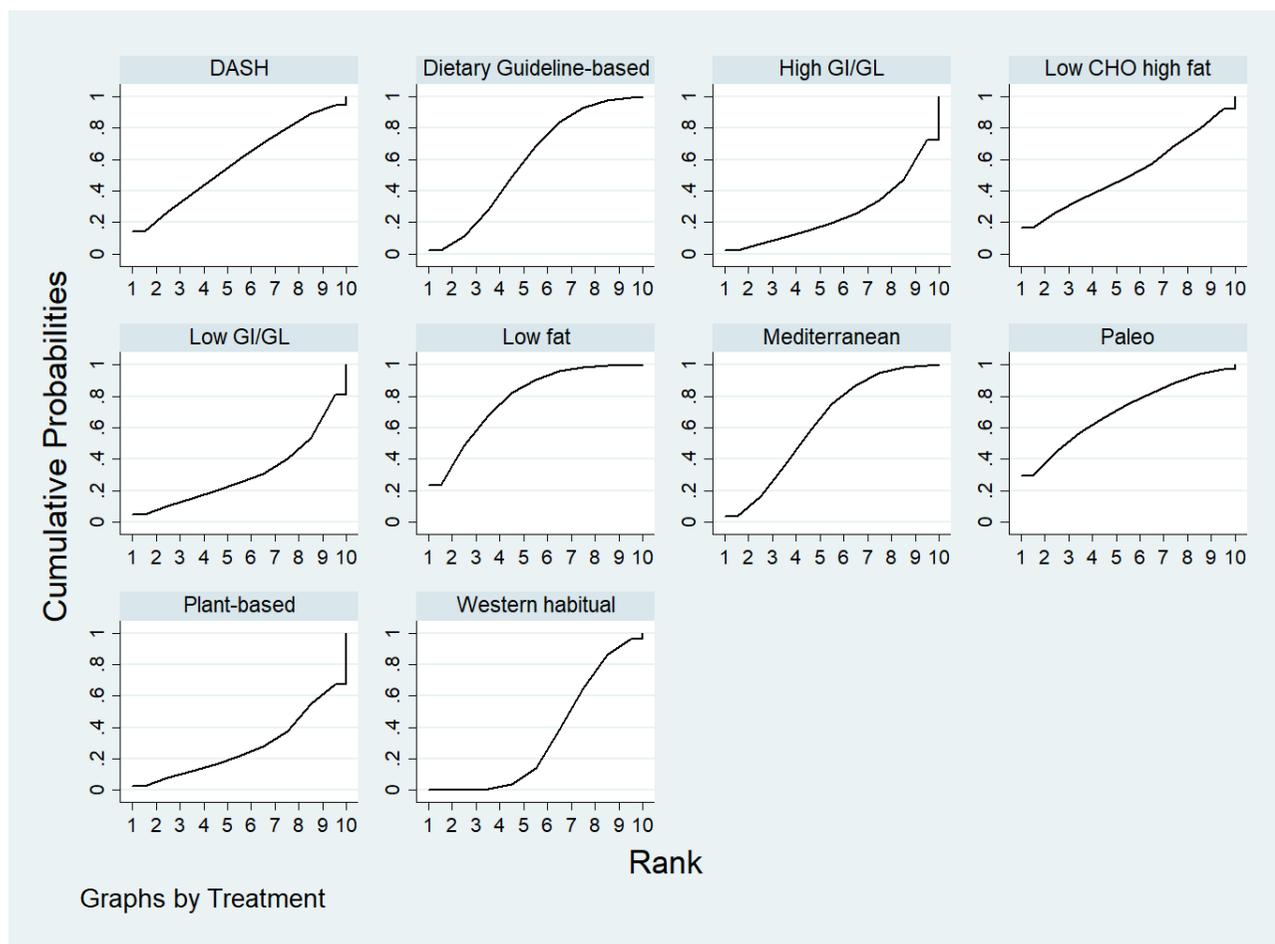

Supplementary Figure S21. Rankograms for glucose<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the DASH, low fat, Mediterranean diet indicating uncertainty in their ranking.

*Abbreviations:* CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension; GI/GL, glycemic index/glycemic load

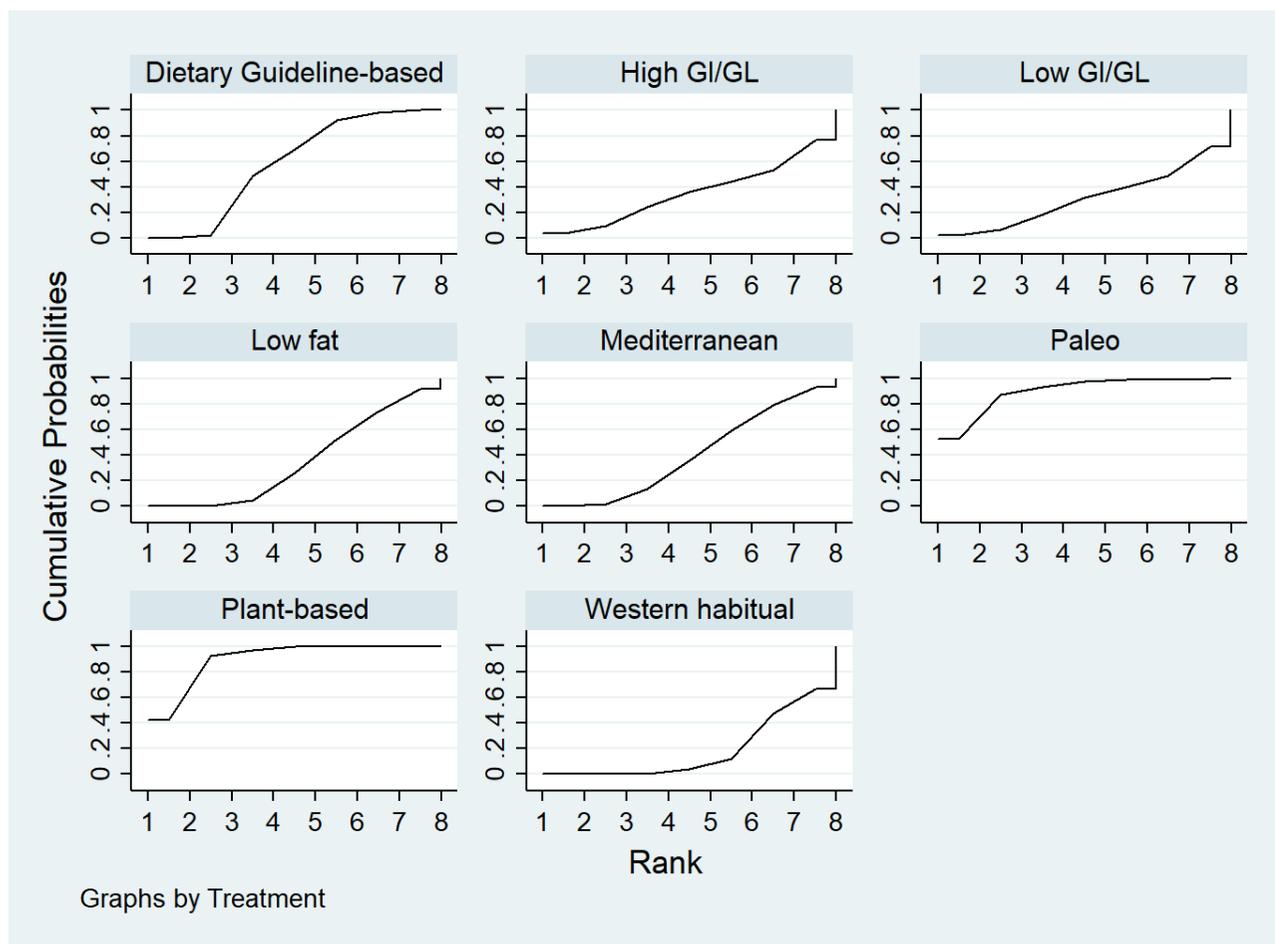

Supplementary Figure S22. Rankograms for insulin<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the DASH, dietary guideline-based, high GI/GL, low GI/GL, Mediterranean, paleo, and plant-based diet indicating uncertainty in their ranking.

Abbreviations: CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension; GI/GL, glycemic index/glycemic load

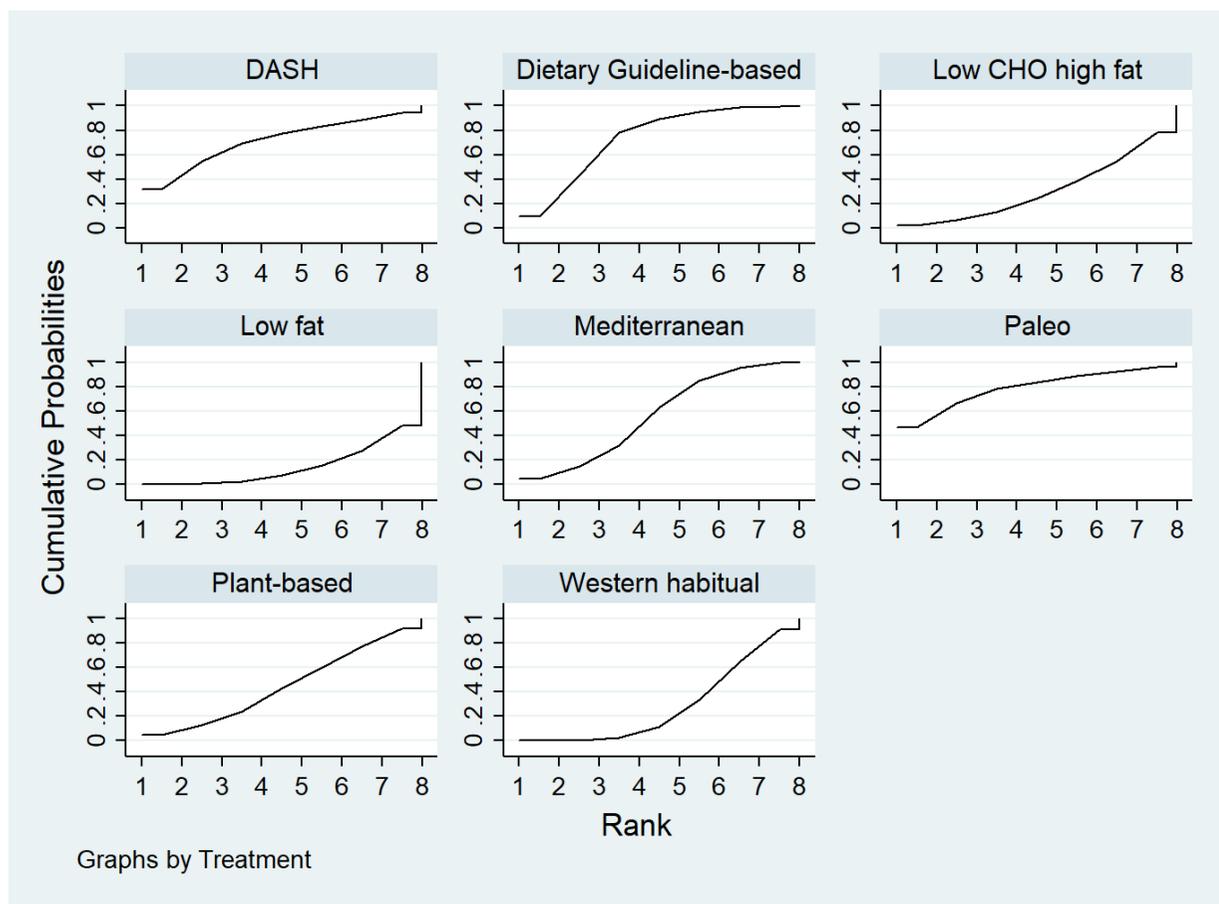

Supplementary Figure S23. Rankograms for HOMA-IR<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the high GI/GL, low GI/GL, paleo and plant-based diet indicating uncertainty in their ranking.

Abbreviations: GI/GL, glycemic index/glycemic load

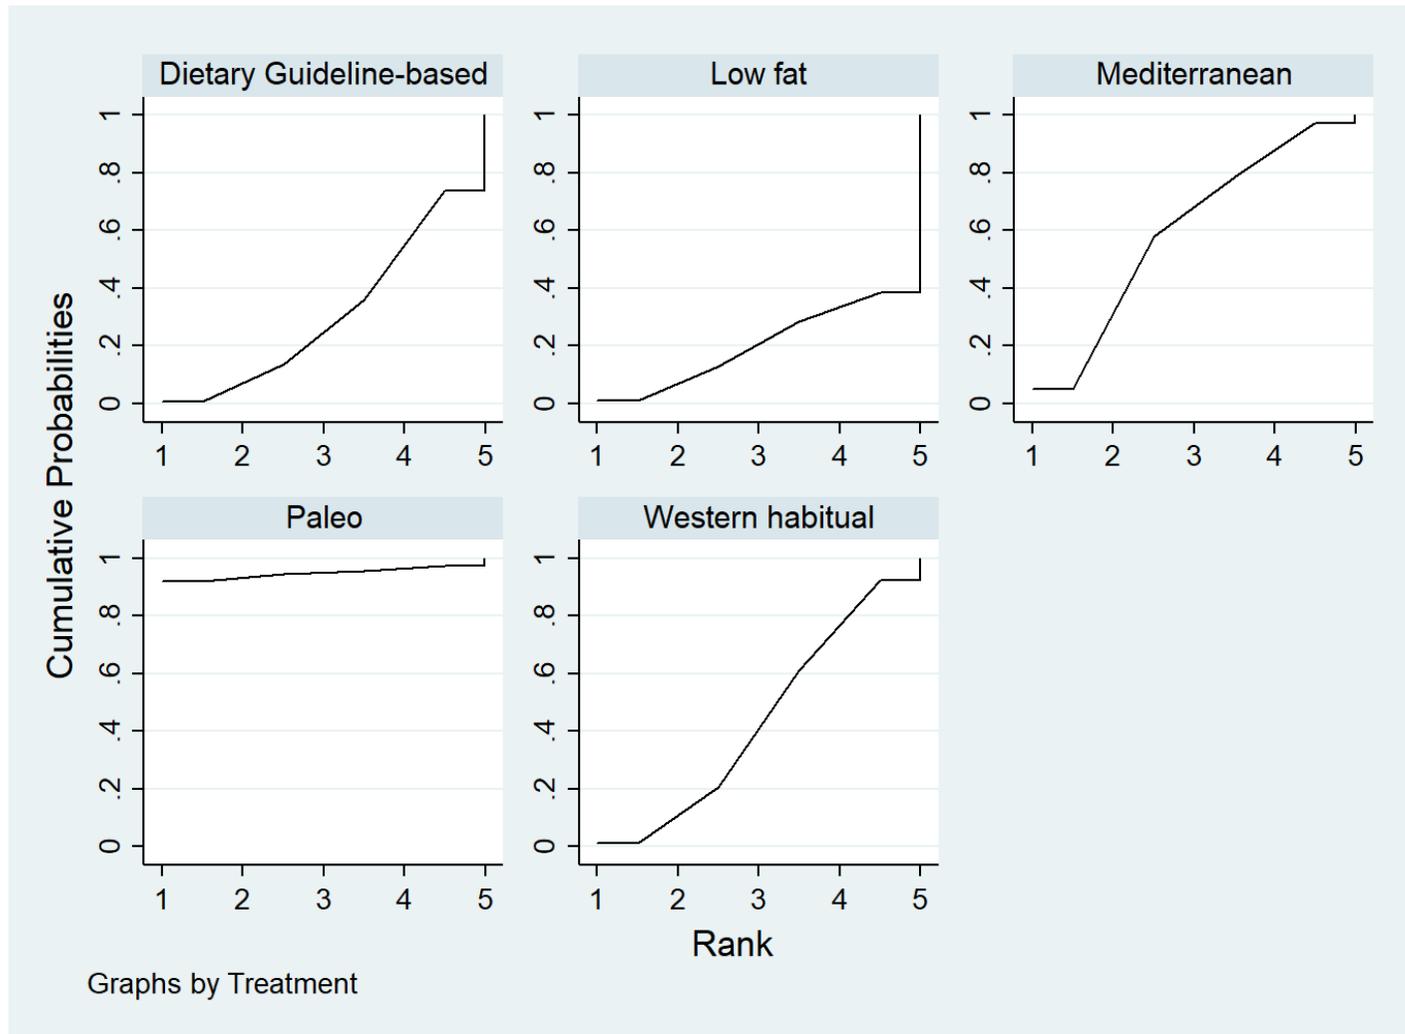

Supplementary Figure S24. Rankograms for hsCRP<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, except for the DASH, low CHO high fat, Mediterranean, and plant-based diet indicating uncertainty in their ranking.

*Abbreviations:* CHO, carbohydrate; DASH, Dietary Approaches to Stop Hypertension

Supplementary Figure S25. Rankograms for interleukin-6<sup>1</sup>

<sup>1</sup>The rankograms in general showed varied distribution of rank probabilities, indicating relatively high certainty in their ranking.

Supplementary Figure S26. Comparison-adjusted funnel plot for LDL-c

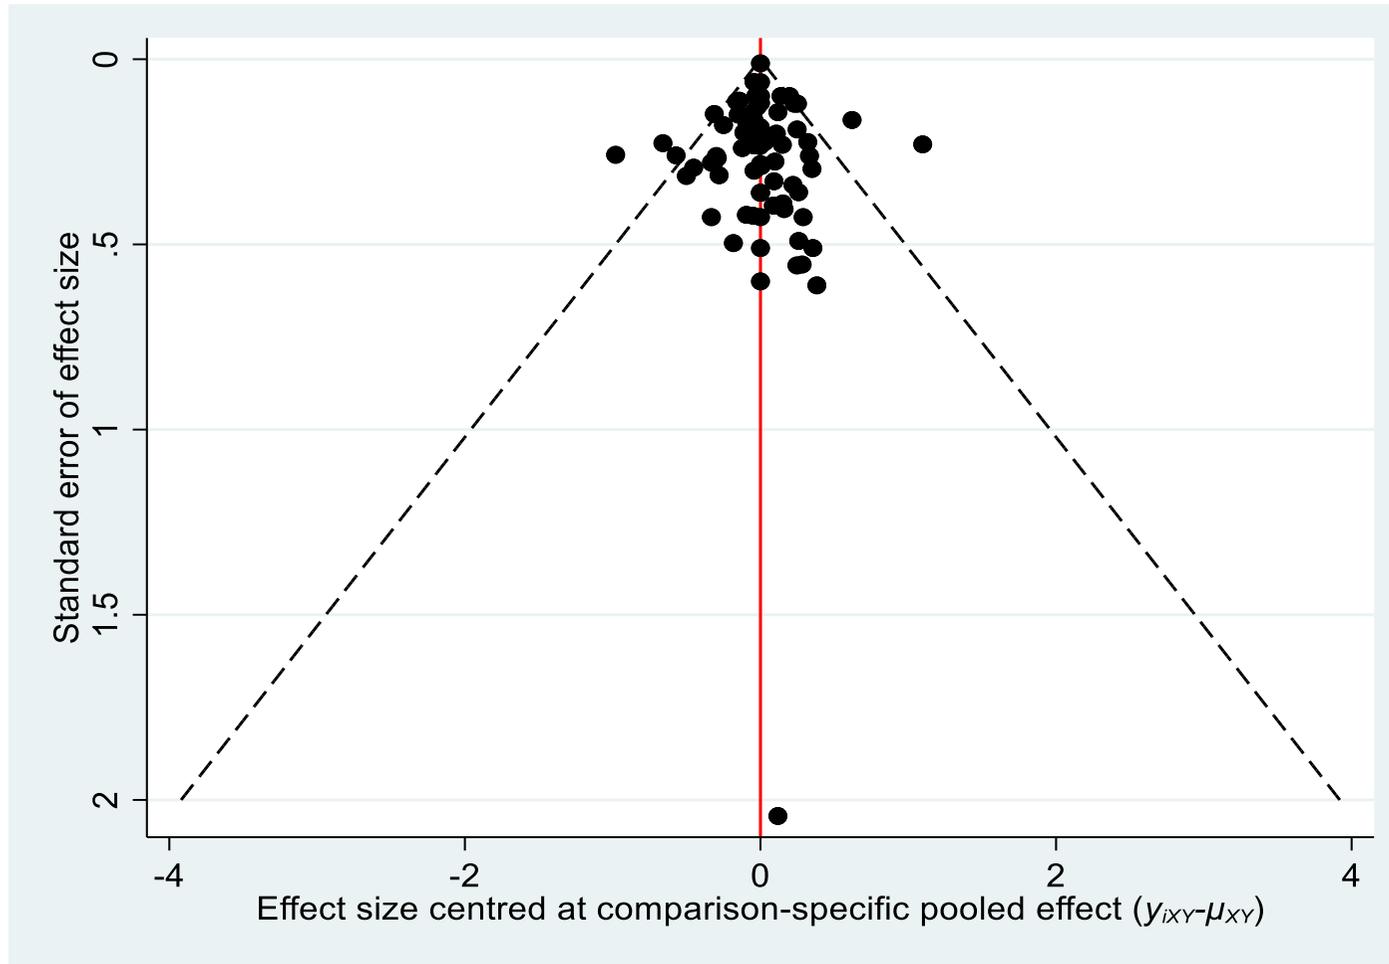

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S27. Comparison-adjusted funnel plot for HDL-c

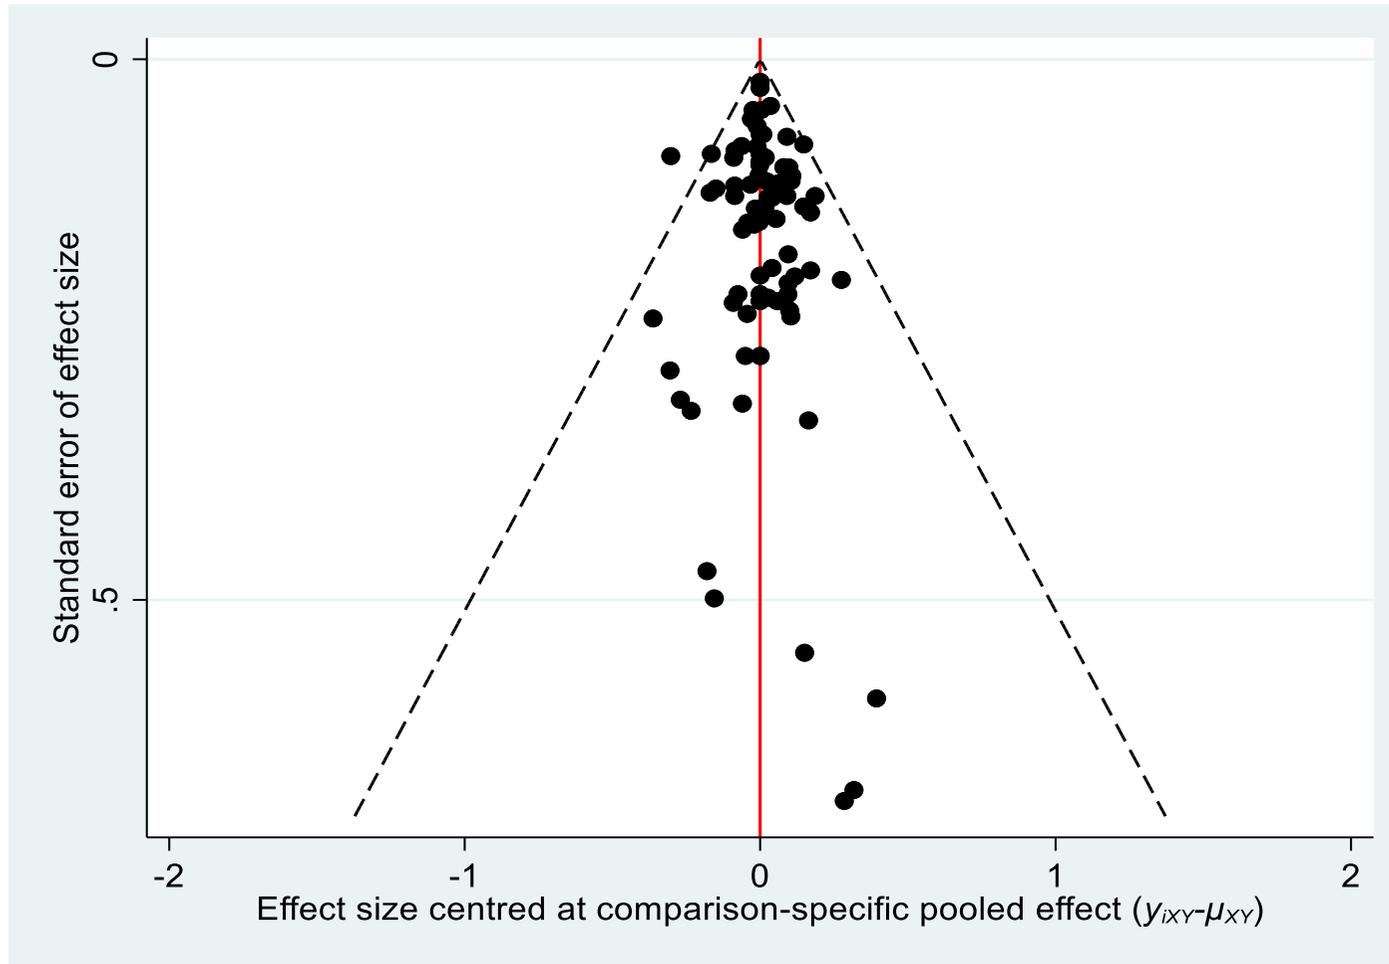

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S28. Comparison-adjusted funnel plot for total cholesterol

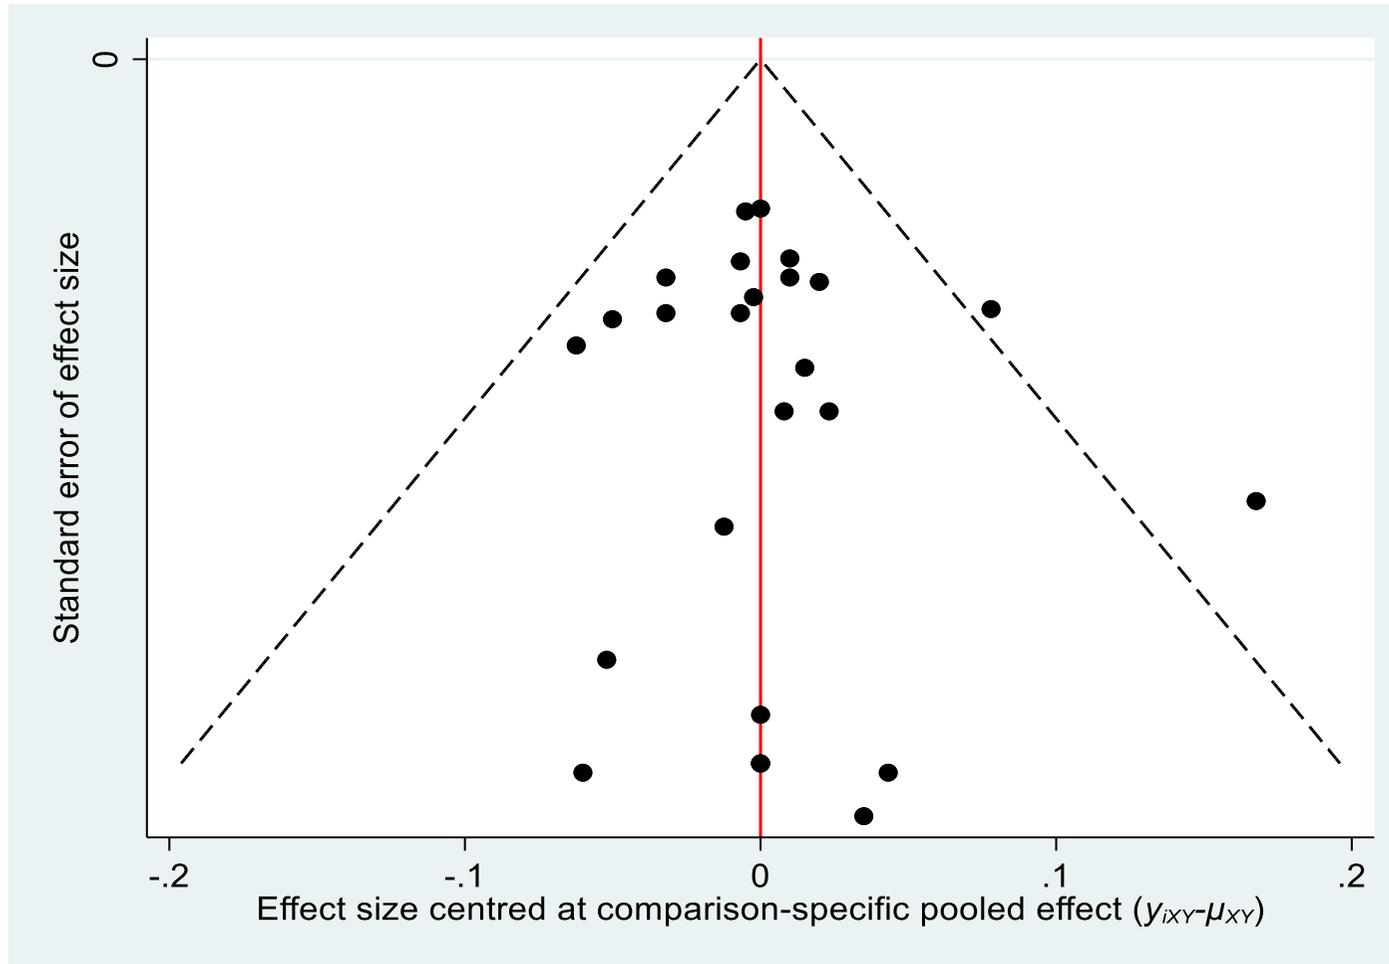

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S29. Comparison-adjusted funnel plot for triglycerides

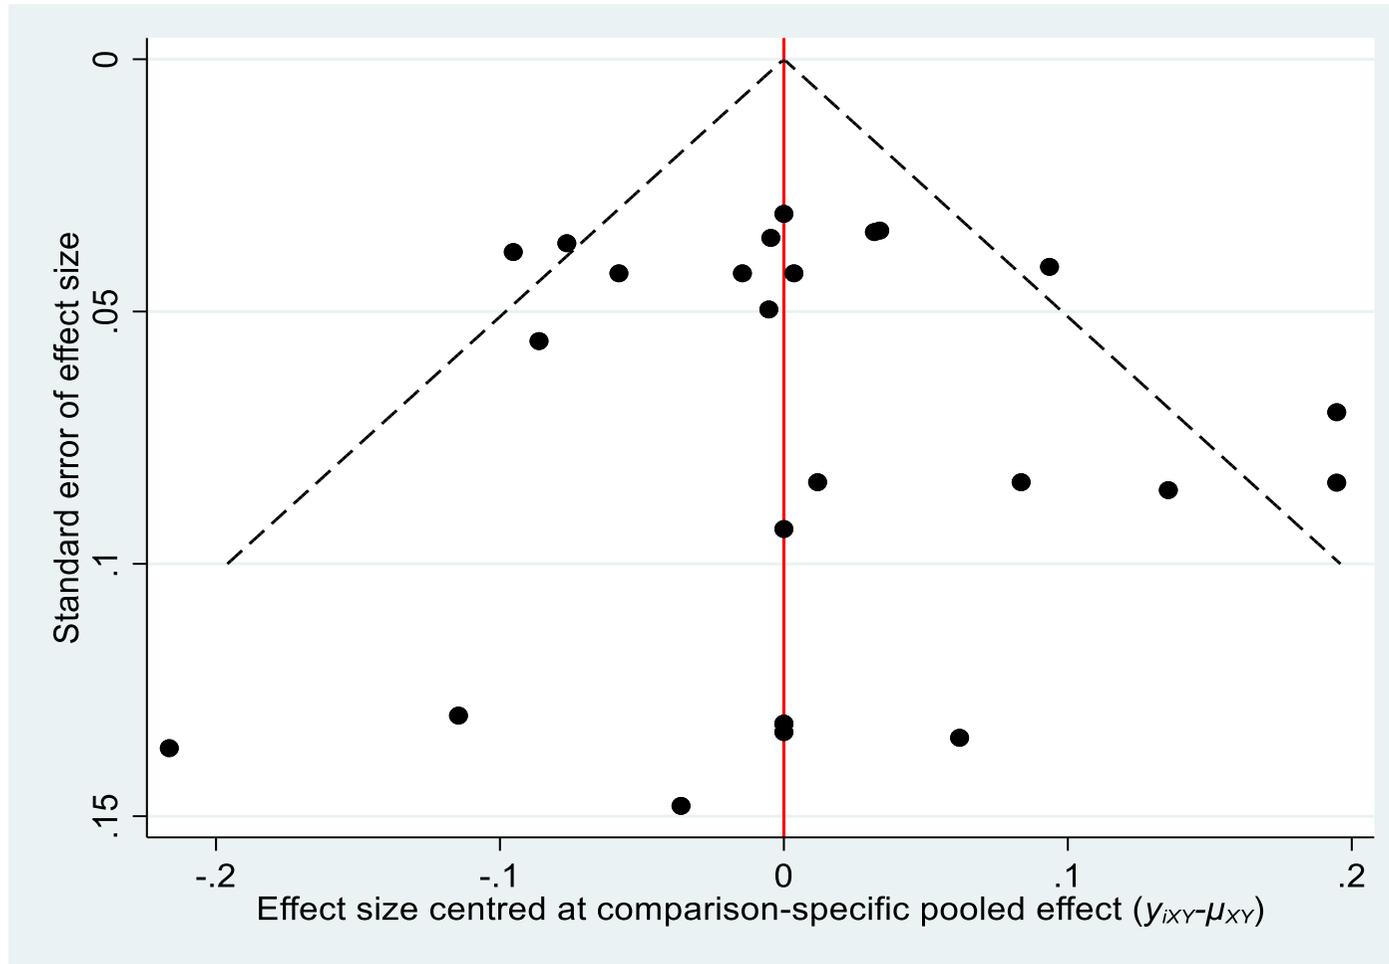

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S30. Comparison-adjusted funnel plot for ApoB

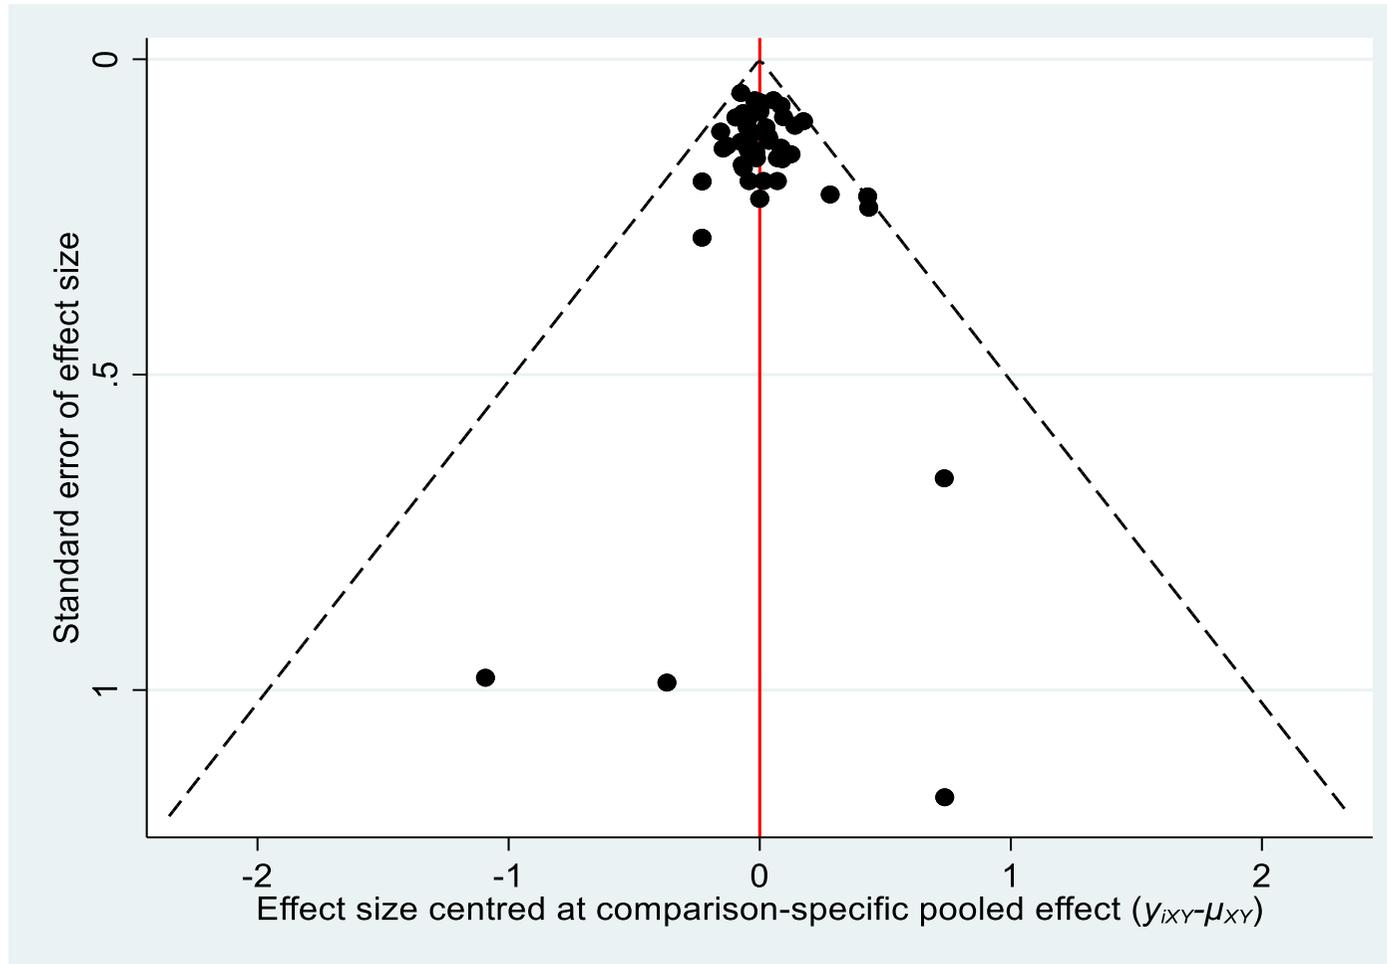

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S31. Comparison-adjusted funnel plot for ApoA1

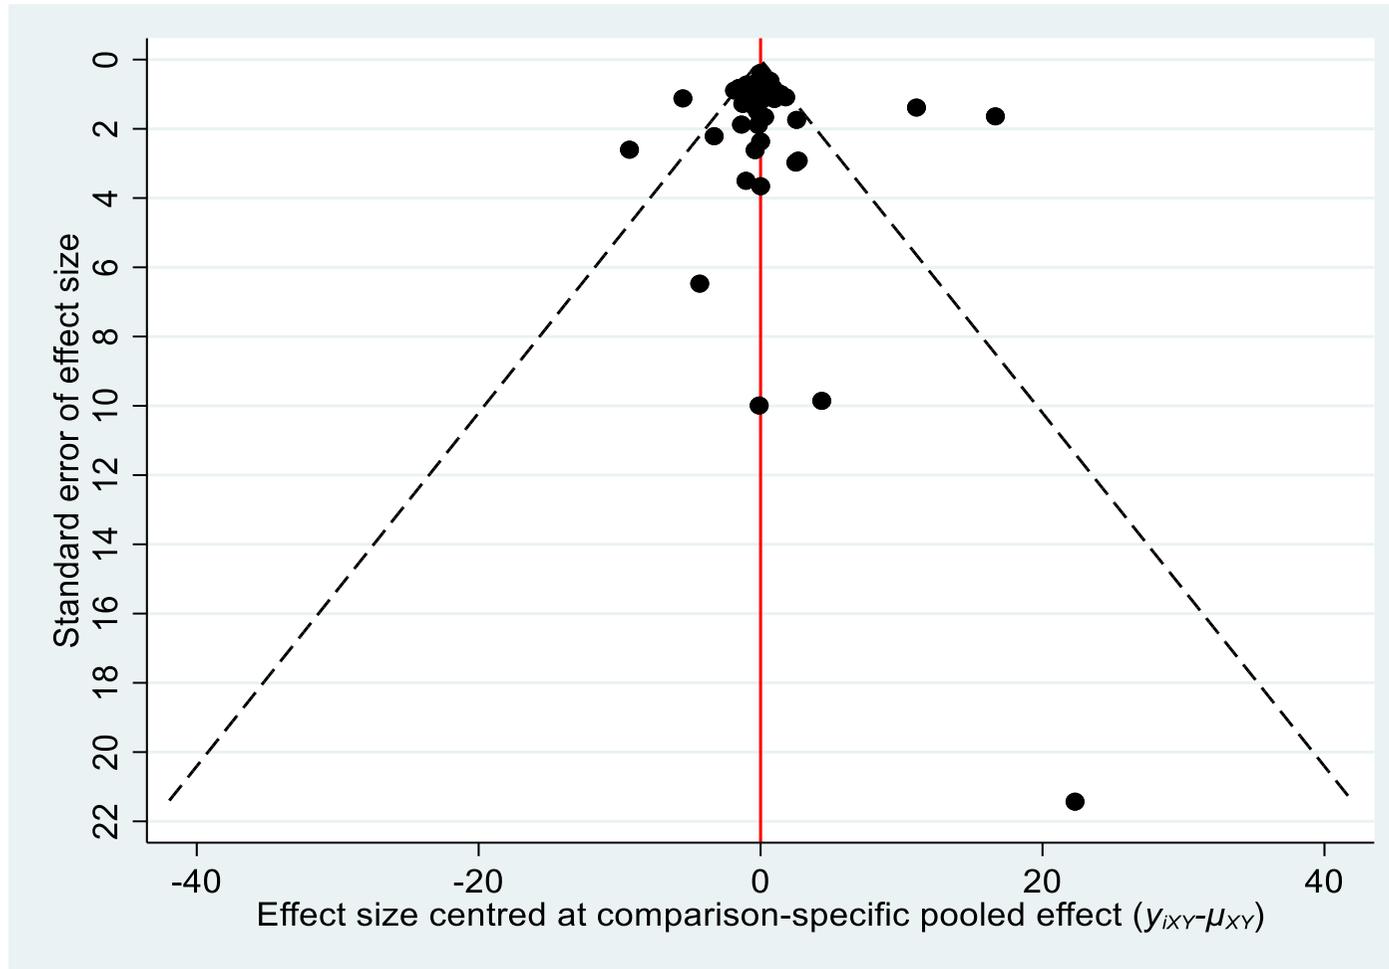

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S32. Comparison-adjusted funnel plot for glucose

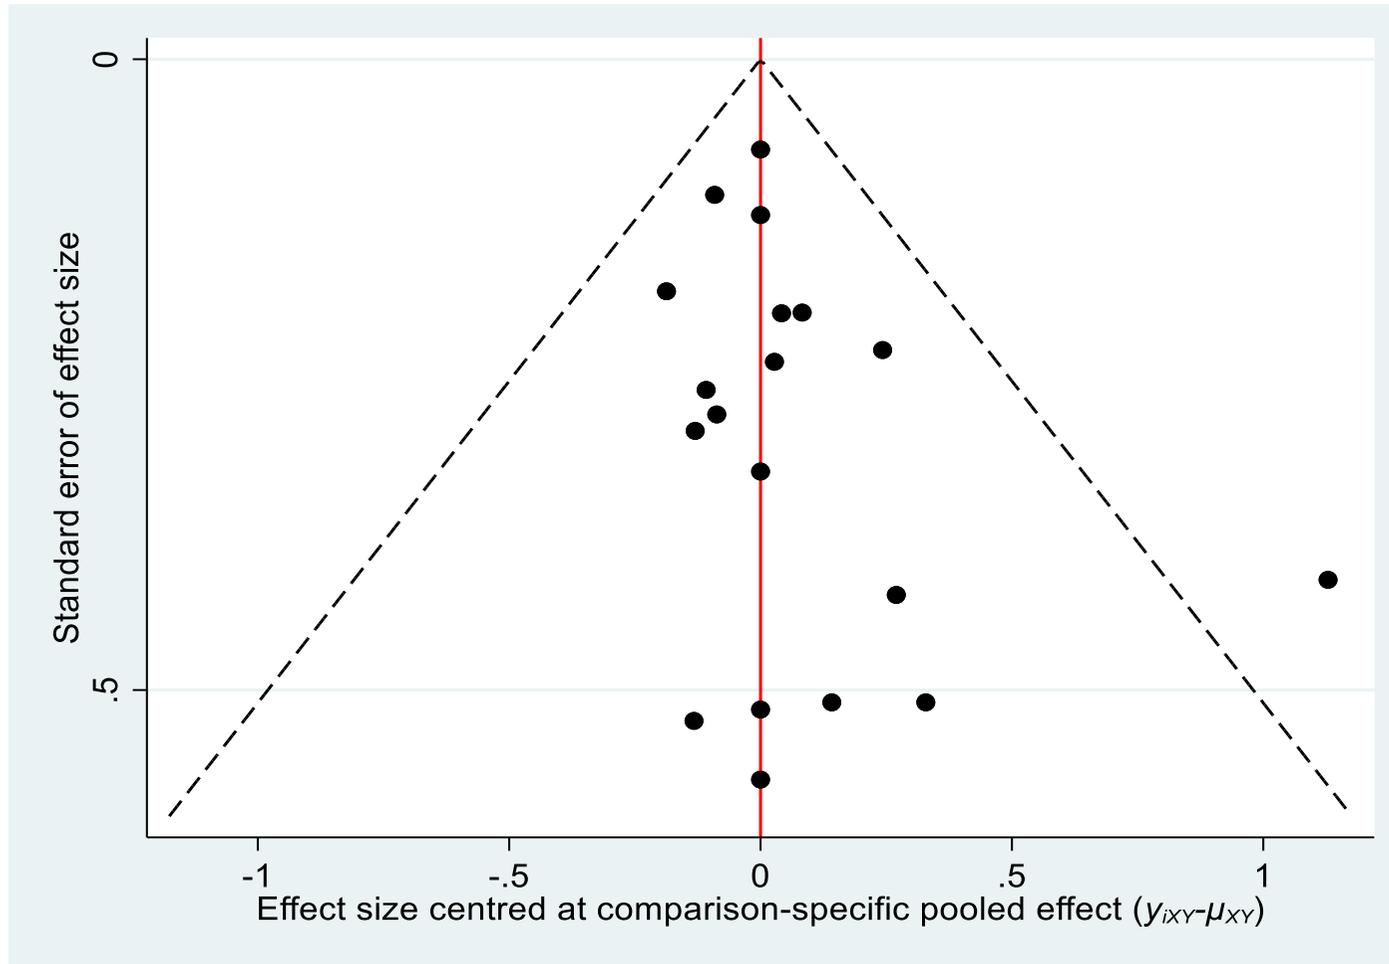

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S33. Comparison-adjusted funnel plot for insulin

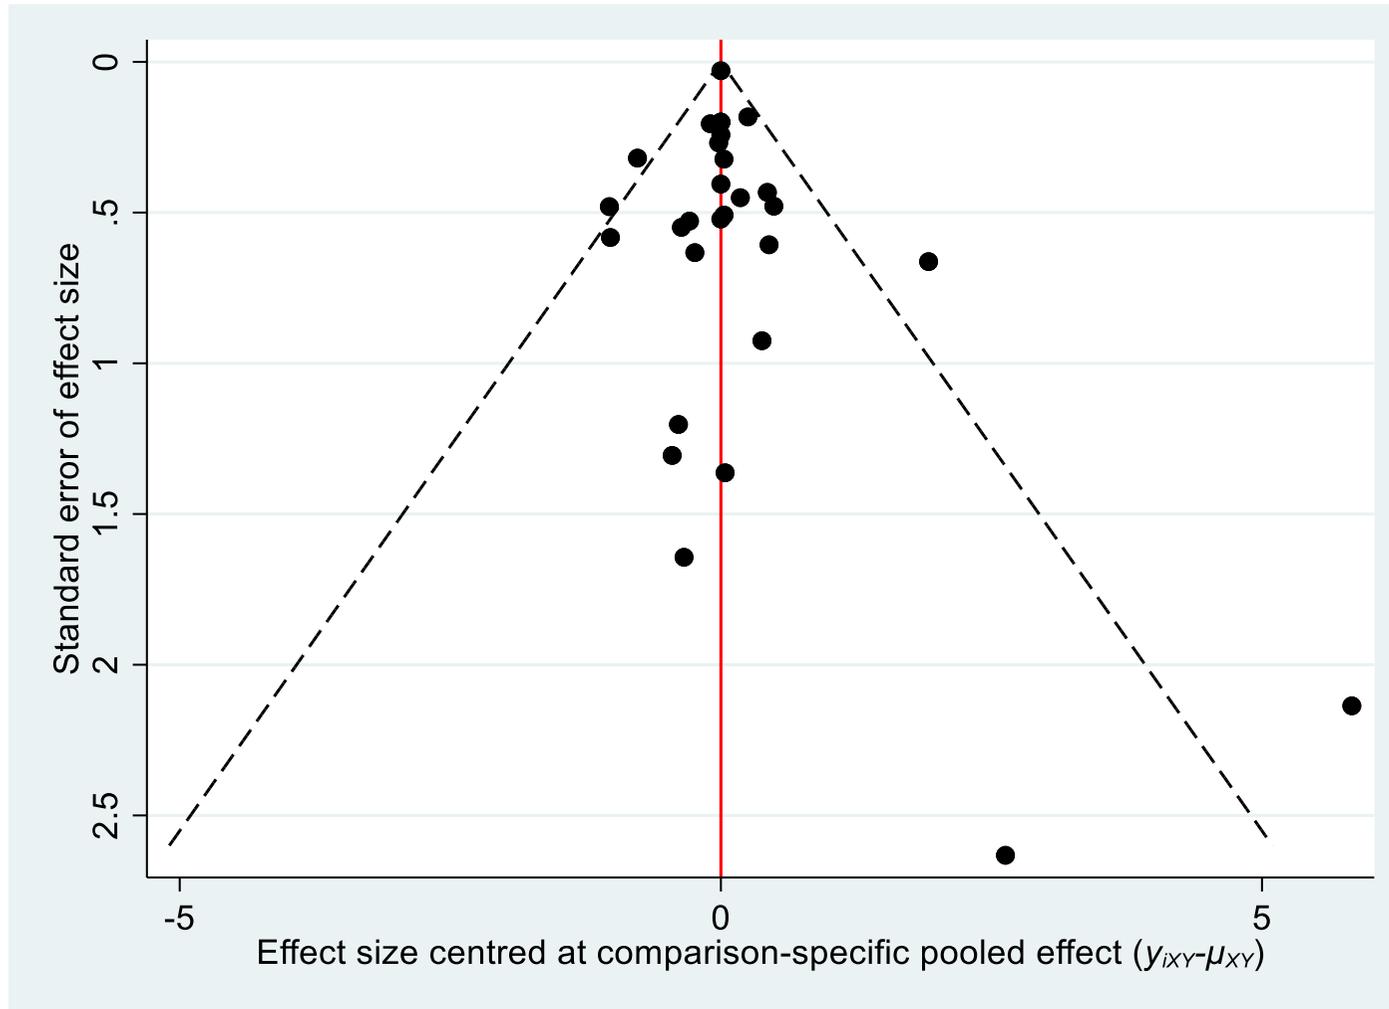

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S34. Comparison-adjusted funnel plot for HOMA-IR

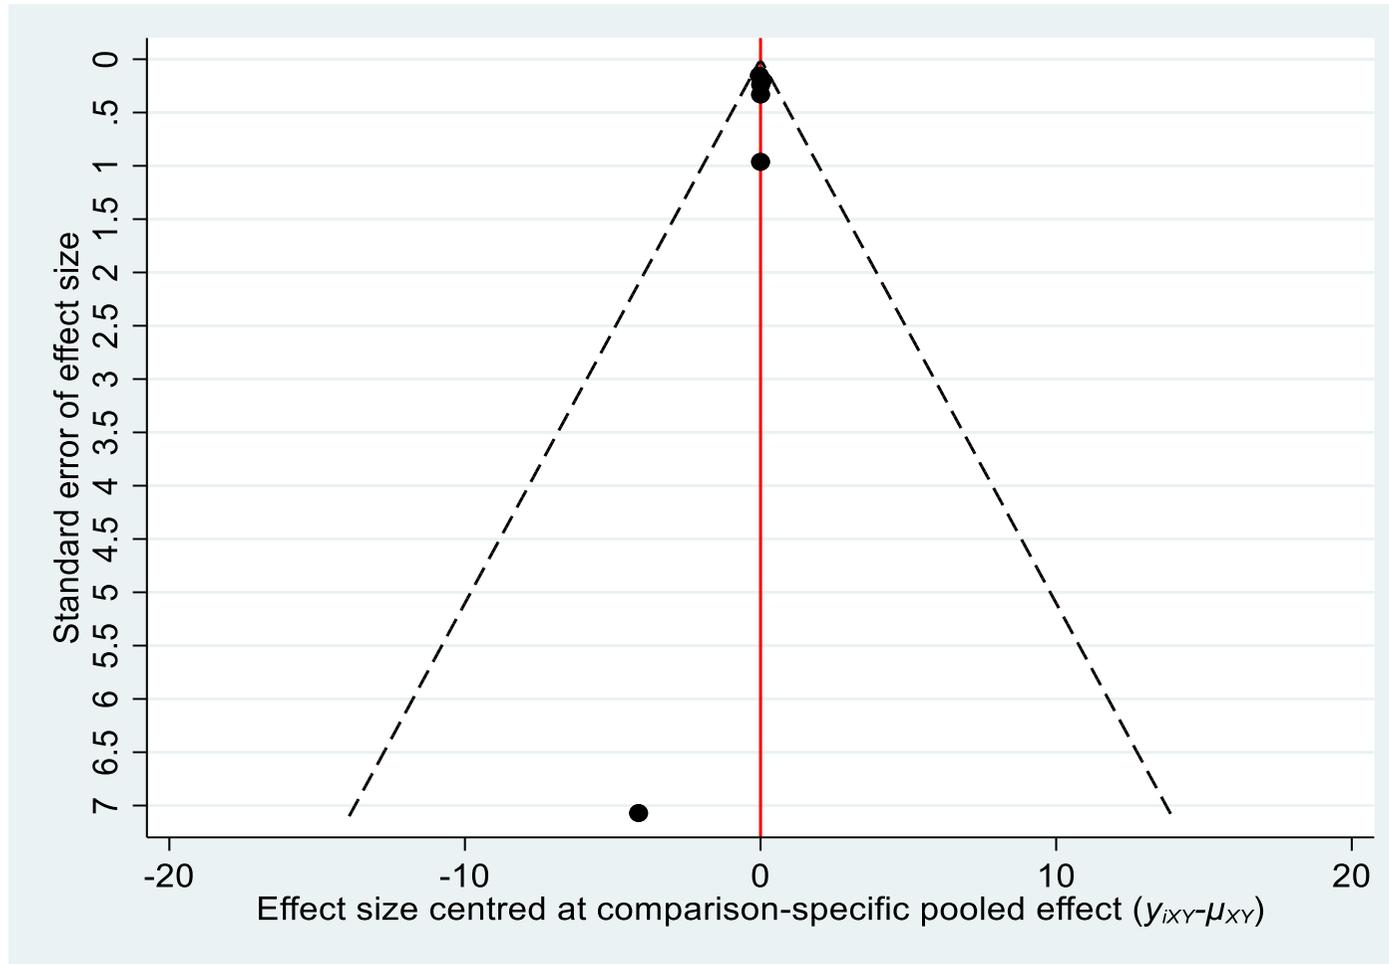

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S35. Comparison-adjusted funnel plot for hsCRP

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

Supplementary Figure S36. Comparison-adjusted funnel plot for interleukin-6

Comparison-adjusted funnel plot showed no asymmetry indicates no evidence of publication bias.

**A** = Mediterranean diet; **B** = Dietary Approaches to Stop Hypertension; **C** = Paleo diet; **D** = Dietary guidelines-based diets; **E** = low GI / GL diet; **F** = plant-based diets; **G** = low fat diet; **H** = low carbohydrate high fat diet; **I** = traditional Mexican diet; **J** = high GI / GL diet; **K** = western habitual diet

Confidence ratings were moderate (43%), low (43%) and very low (14%).

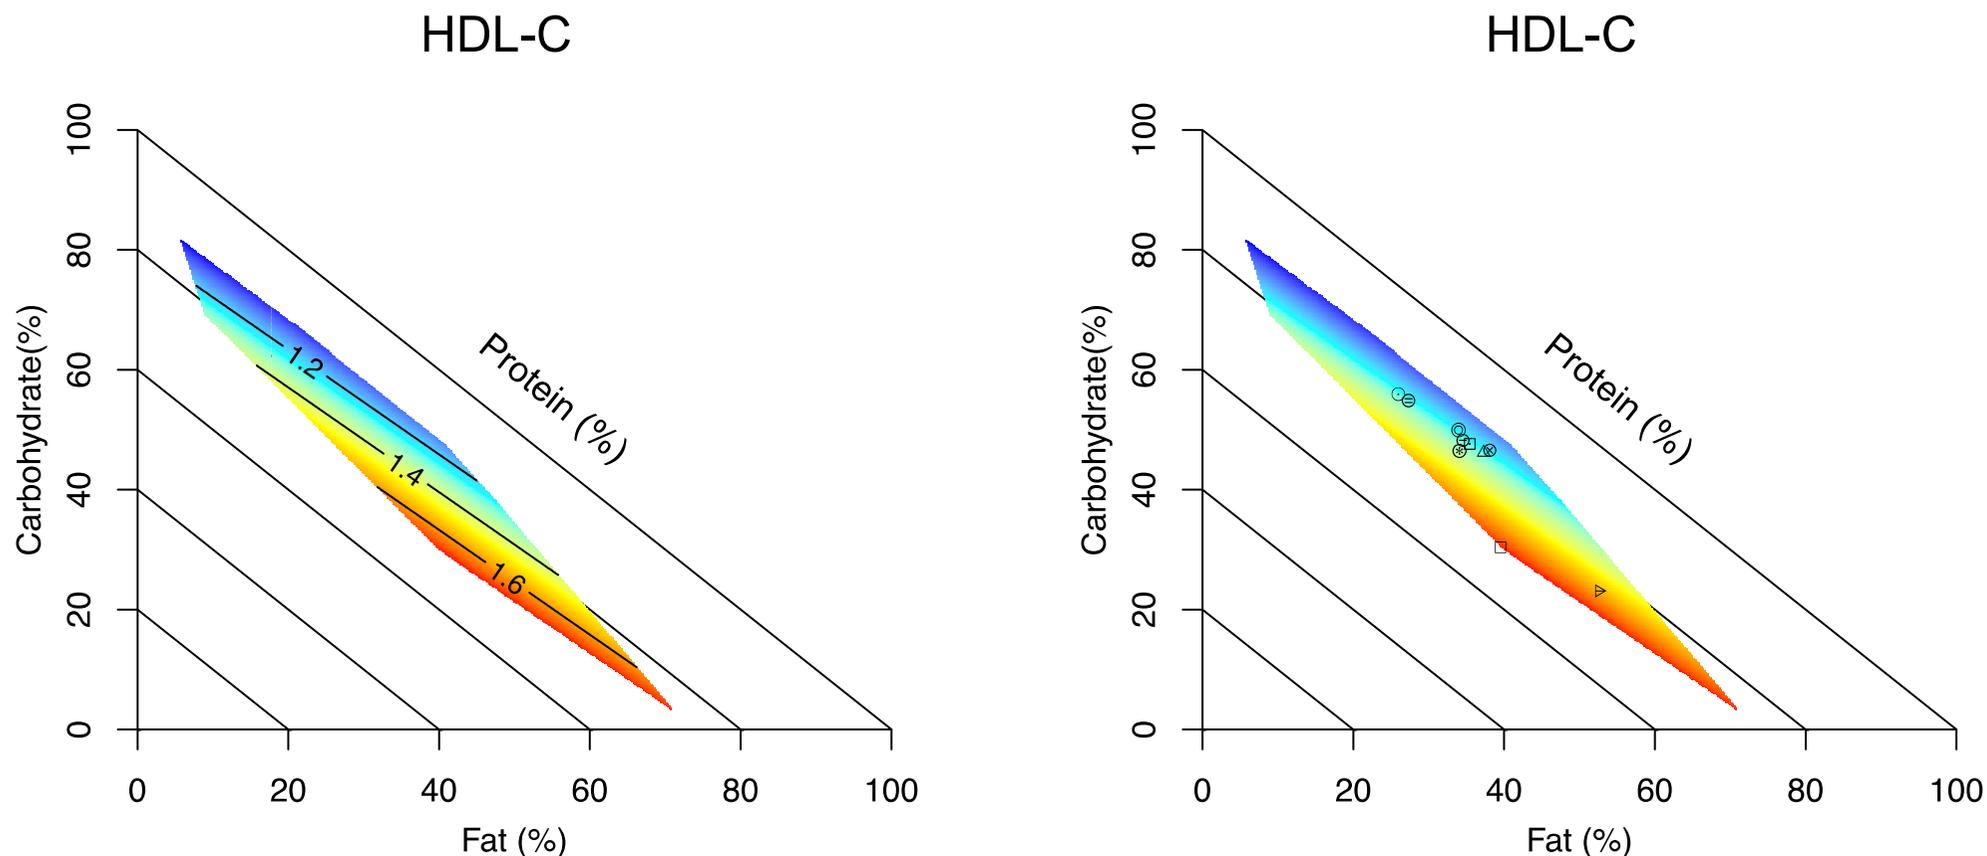

Supplementary Figure S37. Right-angle Mixture Triangles (RMTs) for total cholesterol<sup>1</sup>

△ = Mediterranean diet; ⊙ = Dietary Approaches to Stop Hypertension; □ = Paleo diet; ◻ = Dietary guidelines-based diets; ⊖ = low GI / GL diet; ⊕ = plant-based diets; ⊛ = low fat diet; ▷ = low carbohydrate high fat diet; ⊕ = high GI / GL diet; ⊗ = western habitual diet  
 The symbols on the response surfaces correspond to the average macronutrient composition of each dietary pattern.

<sup>1</sup>Response surfaces with contour lines show the predicted effects superimposed onto a composition triangle for total cholesterol (mmol/L). Each space on these RMTs represents 100% of dietary energy, being the sum of the x-axis (fat), the y-axis (carbohydrate), and an inferred z-axis (protein). A diagonal line closer to the origin corresponds to higher protein (%) intake. The distribution of the surface limited to the intakes observed in the included dietary studies.

Supplementary Figure S38. Right-angle Mixture Triangles (RMTs) for HDL-c<sup>1</sup>

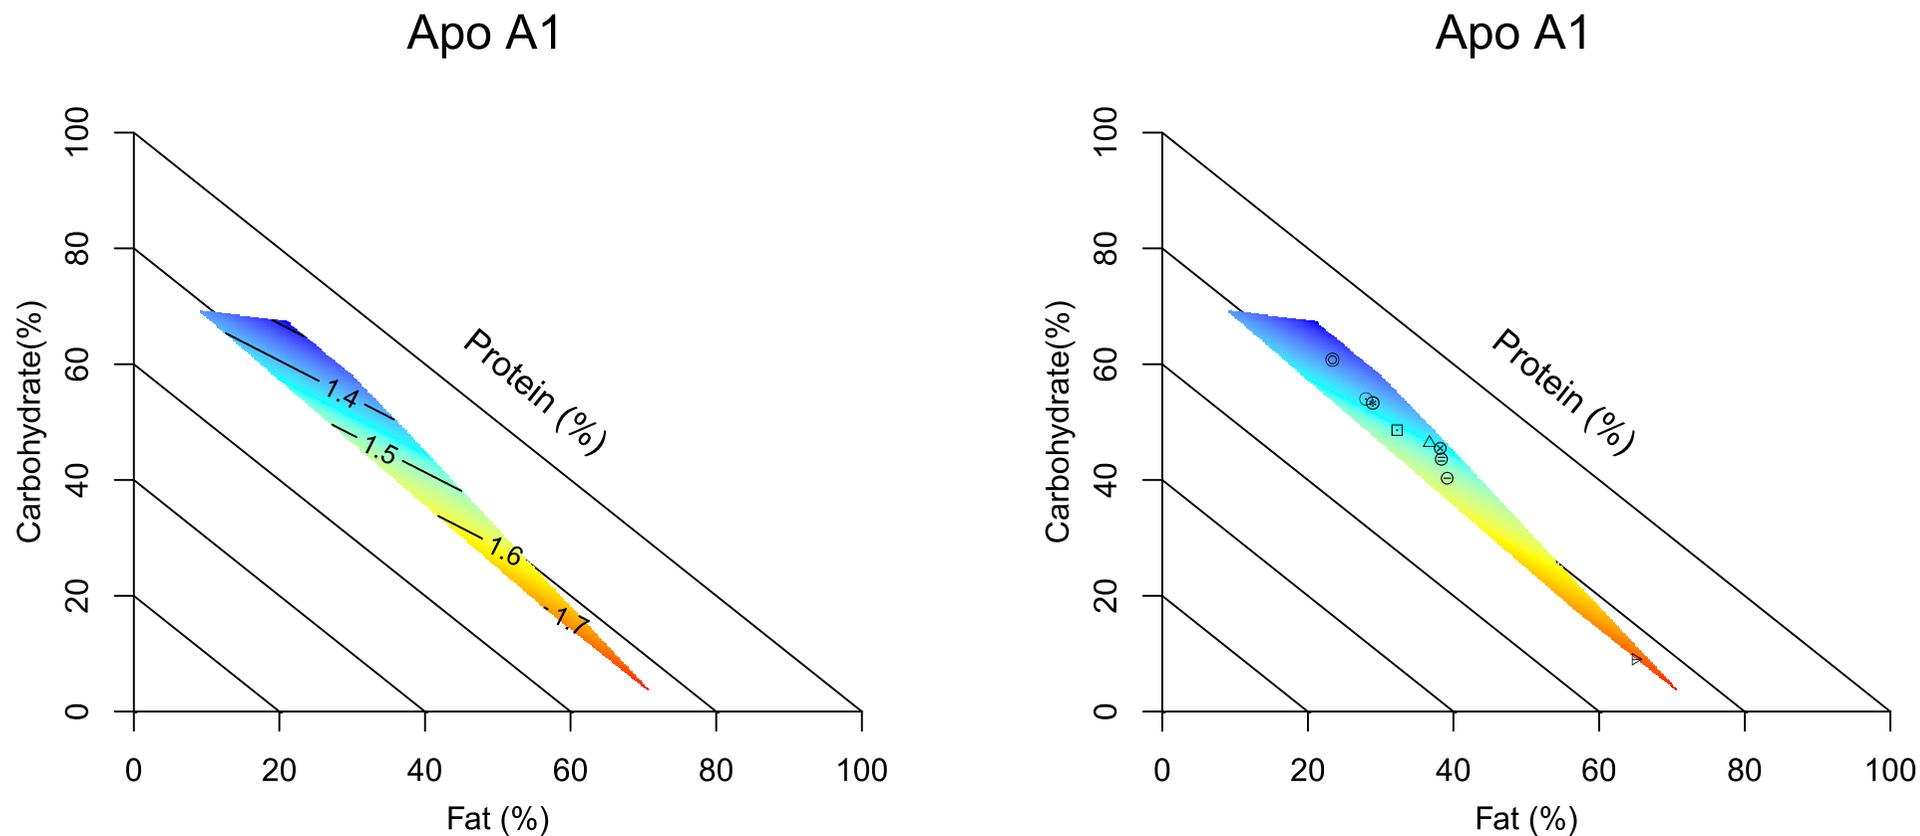

△ = Mediterranean diet; ⊙ = Dietary Approaches to Stop Hypertension; □ = Paleo diet; ◻ = Dietary guidelines-based diets; ⊖ = low GI / GL diet; ⊕ = plant-based diets; ⊛ = low fat diet; ▷ = low carbohydrate high fat diet; ⊕ = high GI / GL diet; ⊗ = western habitual diet

The symbols on the response surfaces correspond to the average macronutrient composition of each dietary pattern.

<sup>1</sup>Response surfaces with contour lines show the predicted effects superimposed onto a composition triangle for HDL-c (mmol/L). Each space on these RMTs represents 100% of dietary energy, being the sum of the x-axis (fat), the y-axis (carbohydrate), and an inferred z-axis (protein). A diagonal line closer to the origin corresponds to higher intake. The distribution of the surface limited to the intakes observed in the included dietary studies.

Supplementary Figure S39. Right-angle Mixture Triangles (RMTs) for ApoA1<sup>1</sup>

△ = Mediterranean diet; ⊙ = Dietary Approaches to Stop Hypertension; ◻ = Dietary guidelines-based diets; ⊖ = low GI / GL diet; ⊕ = plant-based diets; ⊗ = low fat diet; ⊢ = low carbohydrate high fat diet; ⊖ = high GI / GL diet; ⊗ = western habitual diet  
 The symbols on the response surfaces correspond to the average macronutrient composition of each dietary pattern.

<sup>1</sup>Response surfaces with contour lines show the predicted effects superimposed onto a composition triangle for ApoA1 (g/L). Each space on these RMTs represents 100% of dietary energy, being the sum of the x-axis (fat), the y-axis (carbohydrate), and an inferred z-axis (protein). A diagonal line closer to the origin corresponds to higher intake. The distribution of the surface limited to the intakes observed in the included dietary studies.

**Supplementary Table S68.** Coefficients for macronutrient and total cholesterol, HDL-c and ApoA1 Right-angle Mixture Triangles<sup>1</sup>

Total cholesterol: Model 2	Estimate	Standard Error	t-value	p-value
% Protein	7.7451	2.2622	3.4236	0.0009
% Carbohydrate	3.3866	0.4866	6.9603	<0.0001
% Fat	5.2888	0.9021	5.8625	<0.0001
HDL-c: Model 2	Estimate	Standard Error	t-value	p-value
% Protein	3.7677	0.6088	6.1884	<0.0001
% Carbohydrate	0.5904	0.131	4.5069	<0.0001
% Fat	0.9922	0.2459	4.0344	0.0001
ApoA1: Model 2	Estimate	Standard Error	t-value	p-value
% Protein	2.5522	0.6504	3.9241	0.0004
% Carbohydrate	0.9847	0.1278	7.7061	<0.0001
% Fat	1.5414	0.2421	6.3668	<0.0001

<sup>1</sup>Model 2 represents linear associations between macronutrient composition and biomarker outcomes.
