Data is presented for mixed effects models with beta-coefficients, 95% CI and p-values. Findings with $p < 0.05$ are considered statistically significant and bolded.

(a) adjusted for time only

(b) adjusted for age, BMI, sex, time, intake of anti-inflammatory supplements, inflammatory conditions and smoking status

* Remained significant when adjusting for multiple testing using Bonferroni correction.

CRP, C-reactive protein; IL-6, interleukin 6; MUFA, monounsaturated fatty acids; n-3, omega-3; PUFA, polyunsaturated fatty acids; RBC, red blood cell; SFA, saturated fatty acids; TNF- α , tumour necrosis factor α .

Supplementary Table S2: Adjusted and unadjusted mixed-effects models showing the relationship between individual red blood cell membrane fatty acids and inflammatory markers.
