

# The Influence of Vitamin D Status on Cognitive Ability in Patients with Bipolar Disorder and Healthy Controls

## S1. Hierarchical Regression Analyses in Healthy Controls

### S1.1. Attention

The results of the multiple hierarchical regression analysis indicated no significant association between the individuals' levels of 25(OH)D, 24,25(OH)2D3 or VMR and "attention". In all steps (Model 1:  $F(1, 91) = 13.41, p < 0.001$ ; Model 2:  $F(2, 90) = 14.06, p < 0.001$ ; Model 3:  $F(3, 89) = 9.65, p < 0.001$ ; Model 4:  $F(4, 88) = 7.17, p < 0.001$ ; Model 5:  $F(5, 87) = 5.70, p < 0.001$ ), age showed a significant effect on "attention", as well as premorbid IQ once it was taken in the model (see Table S1).

### S1.2. Memory

Age showed a significant effect on memory over all steps of the multiple hierarchical regression analysis. Premorbid IQ showed a significant effect on memory once it was taken in the model (Model 1:  $F(1, 91) = 21.76, p < 0.001$ ; Model 2:  $F(2, 90) = 15.39, p < 0.001$ ; Model 3:  $F(3, 89) = 10.55, p < 0.001$ ; Model 4:  $F(4, 88) = 7.82, p < 0.001$ ; Model 5:  $F(5, 87) = 6.28, p < 0.001$ ). No significant associations between 25(OH)D, 24,25(OH)2D3 or VMR and memory were found (see Table S1).

### S1.3. Executive Function

The results of the multiple hierarchical regression analysis indicated no significant association between 25(OH)D, 24,25(OH)2D3 or VMR and "executive function". In all steps (Model 1:  $F(1, 91) = 23.26, p < 0.001$ ; Model 2:  $F(2, 90) = 23.76, p < 0.001$ ; Model 3:  $F(3, 89) = 15.67, p < 0.001$ ; Model 4:  $F(4, 88) = 11.63, p < 0.001$ ; Model 5:  $F(5, 87) = 9.20, p < 0.001$ ), age showed a significant effect on "attention", as well as premorbid IQ once it was taken in the model (see Table S1).

**Table S1.** Association of age, premorbid IQ, 25(OH)D, 24,25(OH)2D3, VMR with "attention", "memory", and "executive function" in healthy controls.

		Attention			Memory			Executive Function		
		$\beta$	$t$	$p$	$\beta$	$t$	$p$	$\beta$	$t$	$p$
