

Table S1. Composition of human gut microbiota.

PHYLUM	Relative abundance	Genera and species	Main functions
<i>Firmicutes</i>	60-65%	<i>Clostridium</i> <i>Eubacterium</i> <i>Faecalibacterium</i> <i>Lactobacillus</i> <i>Roseburia</i> <i>Ruminococcus</i>	Fiber fermentation and butyrate production
<i>Bacteroidetes</i>	20-25%	<i>Alistipes</i> <i>Bacteroides</i> <i>Parabacteroides</i> <i>Prophyromonas</i> <i>Prevotella</i>	Catabolism of polysaccharides Fiber fermentation and butyrate production
<i>Proteobacteria</i>	5-10%	<i>Escherichia coli</i>	
<i>Actinobacteria</i>	3%	<i>Bifidobacterium</i> <i>Colinsella</i>	Synthesis of vitamins
<i>Archaea</i>	<1%	<i>Methanobrevibacter</i> <i>Methanospaera</i>	Methane production
<i>Deferribacteres</i>	<1%		Iron degradation
<i>Fusobacteria</i>	<1%	<i>Fusobacterium nucleatum</i>	Tumorigenic factor with proinflammatory properties
<i>Melainabacteria</i>	<1%		Production of vitamins B and K, fermentation of carbohydrates, synthesis of ethanol, lactate and formate
<i>Spirochaetes</i>	<1%	<i>Treponema</i>	
<i>Verrucomicrobia</i>	<1%	<i>Akkermansia muciniphila</i>
