

Supplementary Materials: Microcystin Content in Phytoplankton and in Small Fish from Eutrophic Nyanza Gulf, Lake Victoria, Kenya

Benard Mucholwa Simiyu, Steve Omondi Oduor, Thomas Rohrlack, Lewis Sitoki and Rainer Kurmayer

Table S1. Phytoplankton taxa which were discriminated for biovolume estimation.

Genus	Author (Genus)	depth-integrated	surface	patch	shore	Rusinga channel
Cyanobacteria						
<i>Anabaena</i>	Bory ex Bornet					
(<i>Dolichospermum</i>)	& Flahault	x	x	x	x	x
<i>Aphanocapsa</i>	C.Nägeli					x
<i>Chroococcus</i>	Nägeli					x
<i>Cyanodictyon</i>	A.Pascher					x
<i>Planktolyngbya</i>	Anagnostidis & Komárek	x	x	x	x	x
<i>Microcystis</i>	Lemmermann	x	x	x	x	x
<i>Romeria</i>	M.Koczwara					x
<i>Merismopedia</i>	F.J.F.Meyen					x
Chlorophyceae						
<i>Chlamydomonas</i>	Ehrenberg	x			x	x
<i>Coelastrum</i>	Nägeli					x
<i>Pediastrum</i>	Meyen					x
<i>Scenedesmus</i>	Meyen					x
<i>Staurastrum</i>	Chodat					x
Bacillariophyceae						
<i>Aulacoseira</i>	Thwaites	x				
<i>Nitzschia</i>	Hassall					x
Cryptophyceae						
<i>Cryptomonas</i>	Ehrenberg	x	x	x	x	x

X, detected.

Table S2. Meteorological characteristics for dates of fish drying to study the stability of microcystin in fish samples (MET Department, Kisumu Airport).

Date	Air temperature (°C)	Irradiance ($\mu\text{mol photons m}^{-2} \text{s}^{-1}$)	Evaporation (mm/day)	Wind speed (knots) (Cumulative: 11.00 am to 5.00 pm)	Relative Humidity (%) ¹
27 Oct 2011	22.7	866	4	197,084	80
8 Nov 2011	24.95	1185	6.5	83,042	35
5 Dec 2011	23.75	1297	3.5	145,086	78
9 Jan 2012	23.65	1238	6	145,076	62
10 Jan 2012	23.6	1387	6	162,056	66

¹ calculated from temperature, wind speed, and evaporation rate.

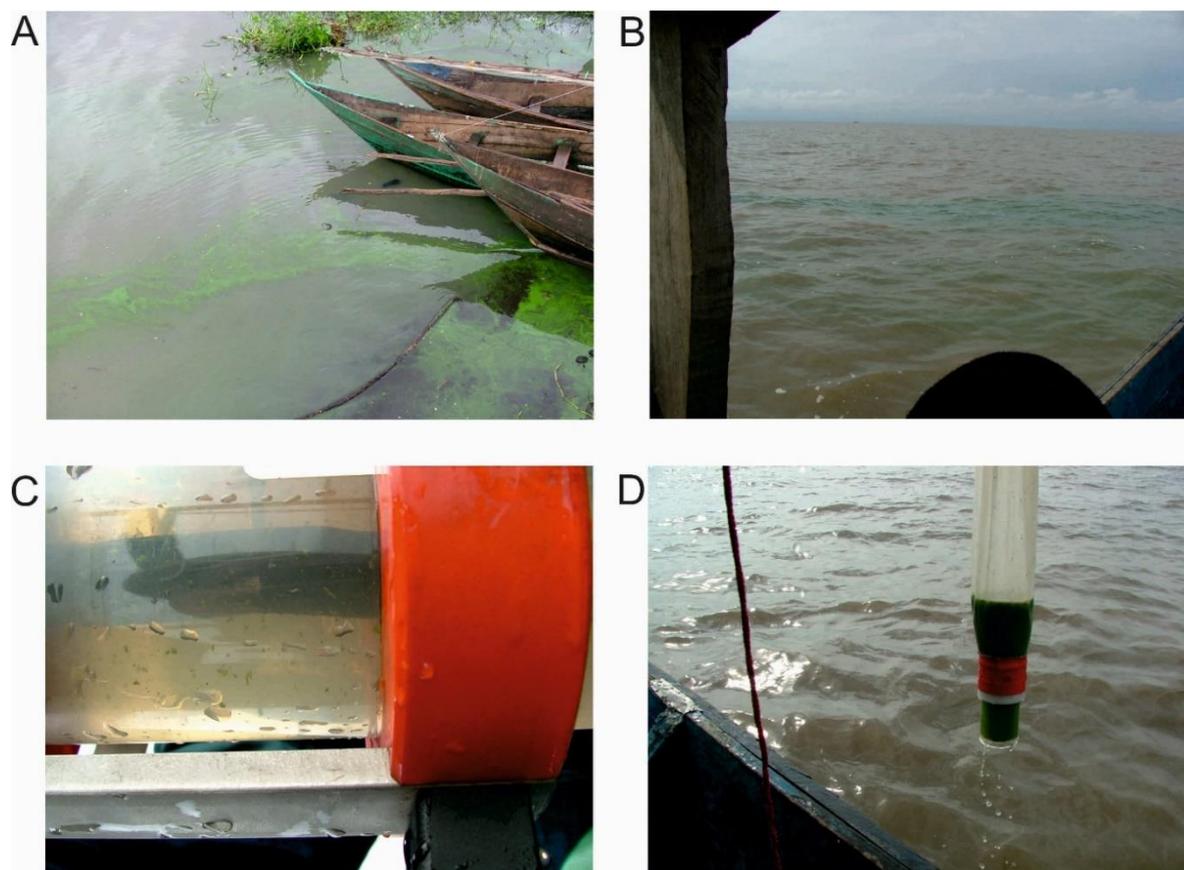

Figure S1. Sampling sites in Nyanza Gulf, L. Victoria showing cyanobacteria mass accumulation, (A) at the shore of the Dunga beach landing site near Kisumu, (B) patches formed by wind action in Kisumu Bay, (C) macroscopic colonies of *Microcystis* in the water sample at ST1, (D) phytoplankton net sample taken at ST1. The maximum MC concentrations were recorded from shore and patch samples (see Figure 2).

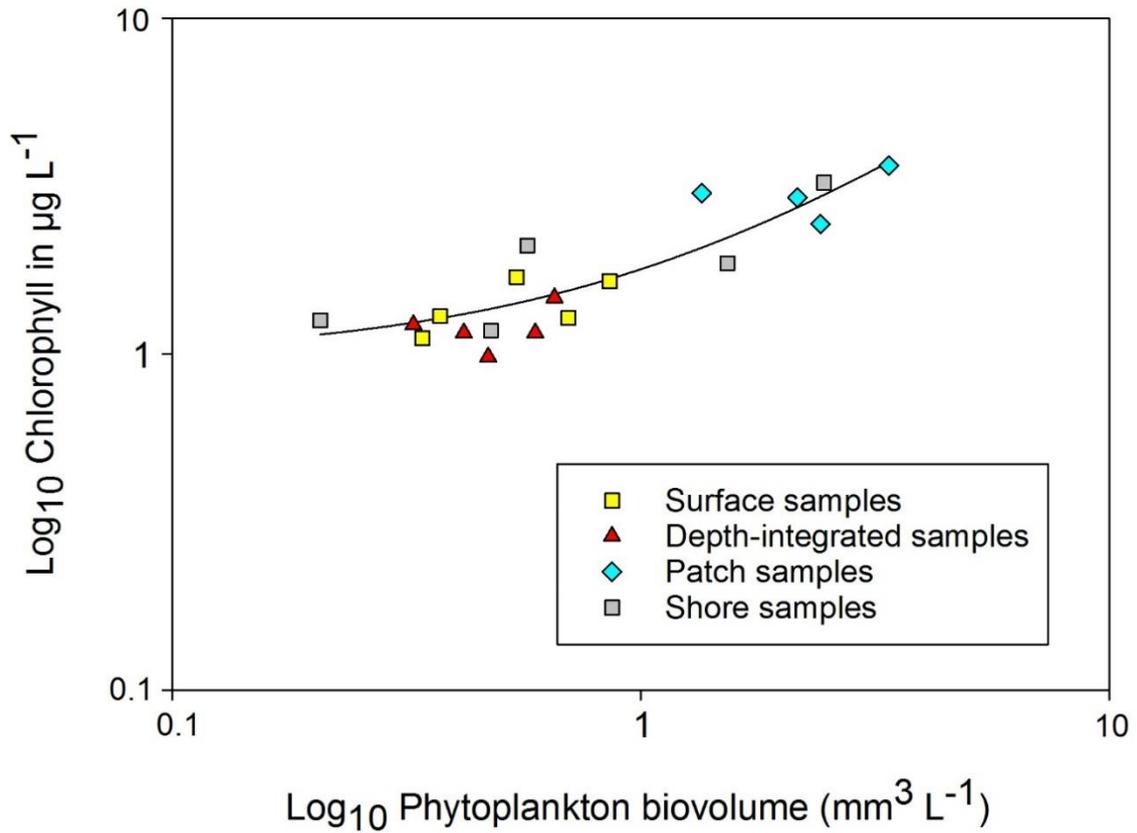

Figure S2. Relationship between total phytoplankton biovolume (mm³ L⁻¹) and Chlorophyll *a* (µg L⁻¹) for all water samples from different sample types in Kisumu Bay, Nyanza Gulf, and Rusinga Channel, Lake Victoria: $y = 0.8132x + 0.9757$, where y is log₁₀ of Chlorophyll *a* (in µg L⁻¹) and x is log₁₀ of phytoplankton biovolume (in mm³ L⁻¹), ($R^2 = 0.81$), ($n = 19$).

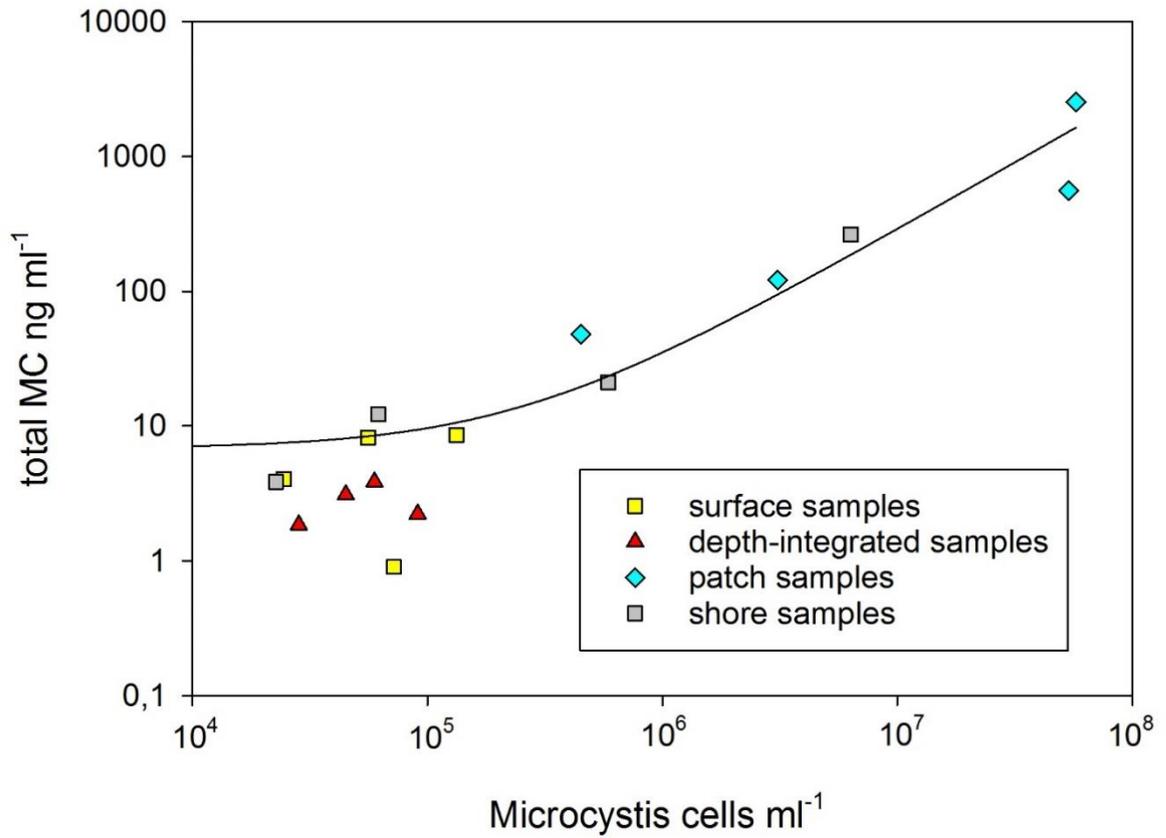

Figure S3. Relationship between *Microcystis* cell numbers and total (intracellular and dissolved) MC concentration for all water samples from different sample types in Kisumu Bay, Nyanza Gulf, and Rusinga channel, Lake Victoria: $y = 2.84 \times 10^{-5}x + 6.8044$, where y is MC in ng/ml and x is *Microcystis* cell number/ml ($R^2 = 0.71$), ($n = 19$). No MC was detected in samples from Rusinga channel.

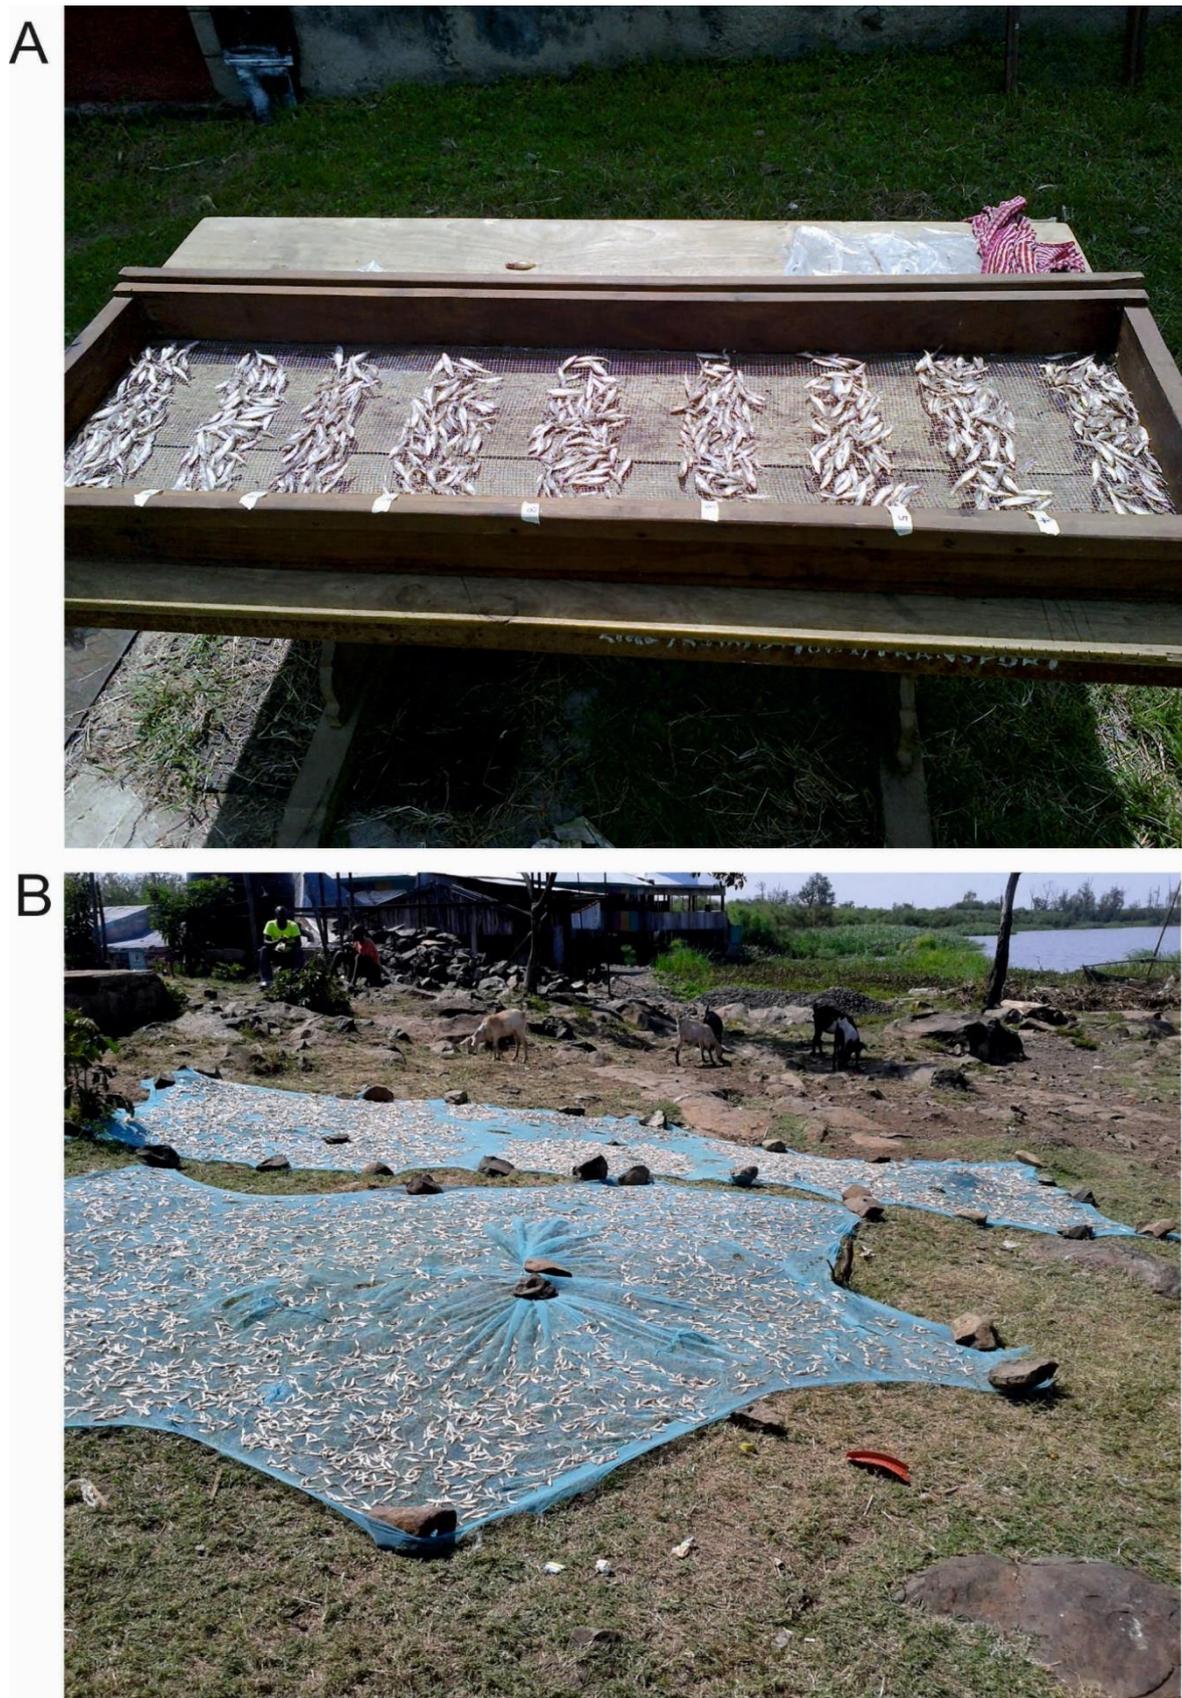

Figure S4. (A) Drying of fish samples for the experiment on microcystin stability (0-8 h), (B) Drying of fish for the market at the Dunga Beach landing site (Kisumu).
