

# Supplementary Materials: Short Linear Motifs Characterizing Snake Venom and Mam-malian Phospholipases A2

Caterina Peggion and Fiorella Tonello

**Table S1.** SLiMs contained in snake venom group I PLA2 and in mammalian PLA2G1B. In brackets the number of proteins belonging to each group; column numbers indicate the number of proteins in the corresponding group that possess the SLiMs listed in the next column.

N°	PLA2G1B (10)	N°	G1 NeuroMyotoxins (7)	N°	G1 Neurotoxins (13)

A

B

**Figure S1.** Percentage of presence of the amino acids A, G, V, L, I, H, P, C, M in the central region of toxins belonging to the group I and mammalian PLA2G1B homologs (panel A) and of toxins of group II and mammalian PLA2G2B homologs (panel B). Other details are described in the main text, Figure 3.

**Figure S2.** Inclination of PLA2G1B and notexin relative to the plasma membrane (PM). **(A)** The tryptophan in position 3 and the charged amino acids in the C-terminal region of PLA2G1B cause the protein to form an angle with the PM. **(B)** In notexin, as in other G1 toxins, tryptophan residues present in 18-19 and in the C-terminal region, together with hydrophobic amino acids in the first alpha-helix, cause the protein to assume a position parallel to the PM.
