

Supplementary Materials: Measuring Surface and Interfacial Tension In Situ in Microdripping Mode for Electrohydrodynamic Applications

Karim I. Budhwani, Gerald M. Pekmezi and Mohamed M. Selim

1. Experimental Materials and Methods

Minor changes were made to setup described in earlier studies. A KDS-410 (kdScientific®, Holliston, MA) syringe-pump was connected to stainless steel 14g needle (1.600/2.108 mm inner/outer diameter. Ramé-hart co.) using 1/16" Tygon® tubing. A Teledyne Dalsa Genie® CR-GM00-H6401 camera fitted with 10x macro lens was connected to a computer running custom LabView® 2016 (Vision Acquisition Software® 2017, and Vision Development Module® 2016) and MATLAB 2017a (MathWorks®) programs. Parameters such as nozzle diameter, flowrate, density, and viscosity were configured for a low Weber number. Droplet frequencies near 1-5 Hz minimize computational resources and control experimental variance. Conditions such as atmospheric saturation, nozzle-plane leveling, and surrounding vibration were monitored. Ethanol (70% v/v) purchased from Ricca Chemical Company (Arlington, TX). Molecular-biology-grade chloroform and non-ionic surfactant Tween® 20 purchased from Fisher Scientific (Fair Lawn, NJ). All experiments were at least performed in triplicate. At least 3 measurements were made for all experimental observations.

2. Function dkAnalyze (MATLAB® Script)

MATLAB® script encoding drop-kick algorithm for analyzing signals derived from both CFD output and CCD video.

```
function [hzDrops, sdDrops, hzWsd, wsdHarmonic, hzFft, fftHarmonic] =  
dkAnalyze(peakSignal, rawSignal, fps, pathName, fileName)  
% function dkAnalyze(peakSignal, rawSignal, fps, pathName, fileName)  
  
% Calculate periodicity and DK frequencies for input signal "rawSignal"  
% recorded at "fps" frame rate (sampling frequency) using multiple  
% algorithms. Start with average drop rate from "peakSignal". Plot results  
% from each algorithm on a single side-by-side figure (saved as "fileName"  
% in folder "pathName") for a quick visual analytical and validation view  
% of drop kinetics and periodicity.  
% Spectral analysis algorihms: Welch's power spectral density and FFT.  
  
% 1. Initialize variables  
% 1a. Length of signal (# of images)  
L = length(peakSignal);  
  
% 1b. % Next power of 2 from 100 times signal length to produce output with  
% more frequency bins closely spaced for higher resolution.  
NFFT = 2^nextpow2(L*100);  
  
% 1c. Handle to figure  
hFigure = figure;  
hFigure.Position = [100 300 1200 400];
```

3. Ansys® Fluent® Runtime Parameters for Water-Air SFT

Version

Fluent
Version: axi, pbns, vof, lam, transient (axi, pressure-based, VOF,
laminar, transient)
Release: 18.0.0
Title:
