AAHGS: AA men with high Gleason score; CAHGS: Caucasian men with high Gleason score

AALGS: AA men with low Gleason score; CALGS: CA men with low Gleason score

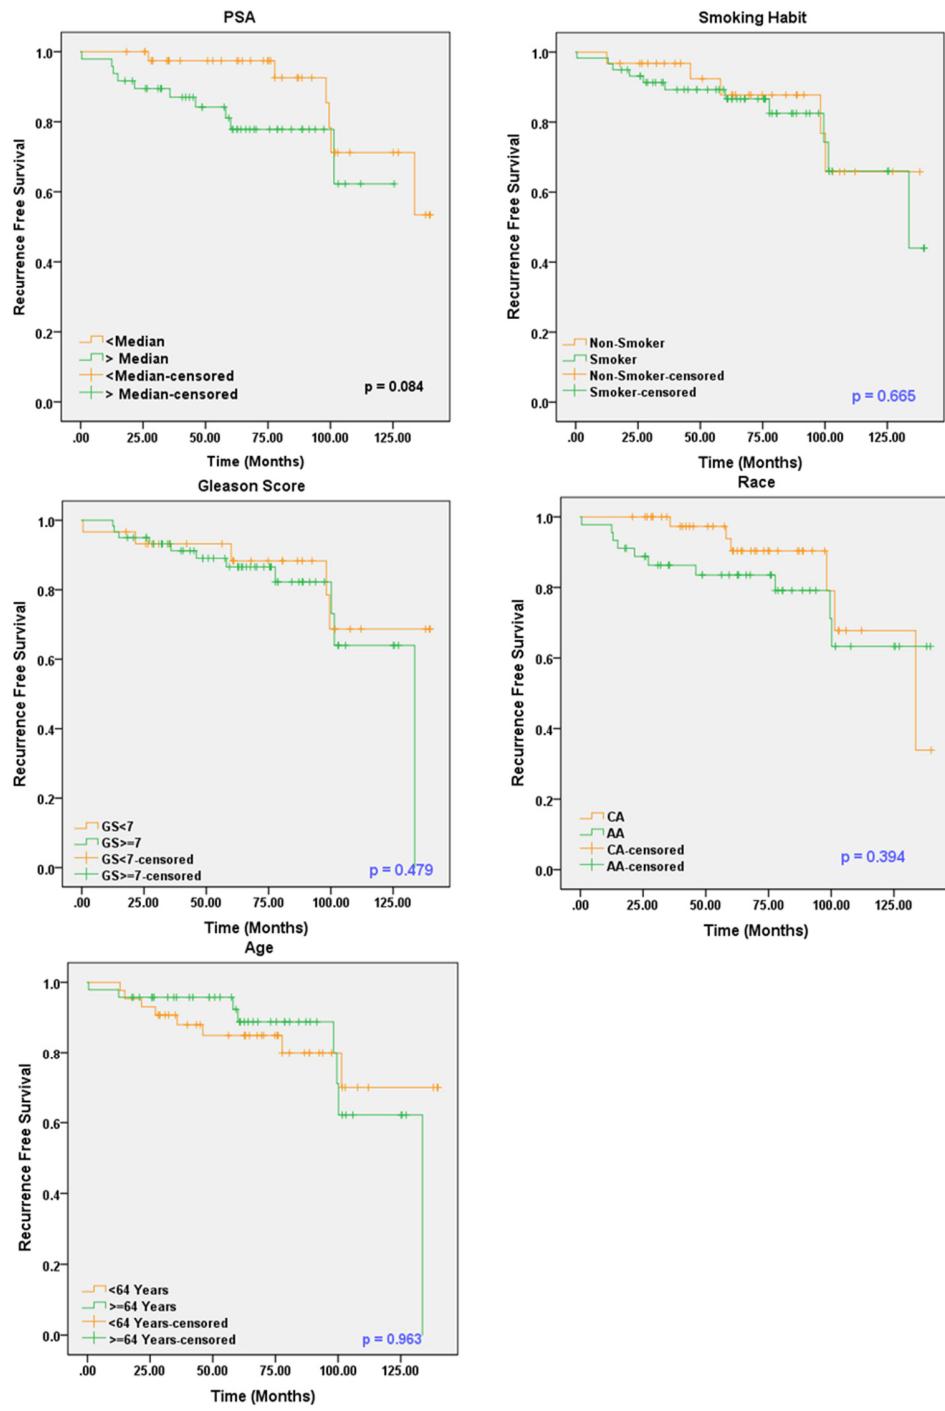

Figure S1. Expression of surface markers proteins in small extracellular (sEVs) vesicles derived from plasma of PCa patients. Western blot was performed on sEVs derived from plasma collected from AA and CA patients. The membrane was incubated with anti-CD63, CD9 and CD81 antibodies. Plasma free from sEVs was used as a negative control. The developed signal was visualized at low and high exposure times.

Figure S2. Pathway prediction for small extracellular vesicle-associated miR-3201, miR-5001-5p, miR-6068, miR-6716-5p, miR-1915-3p, miR-3944-5p, miR-3939, miR-3692-3p, and miR-5189-5p. Pathway prediction was performed for sEV-associated miRs that can discriminate PCa patients from normal individuals (A), Gleason score (B) and race (C).

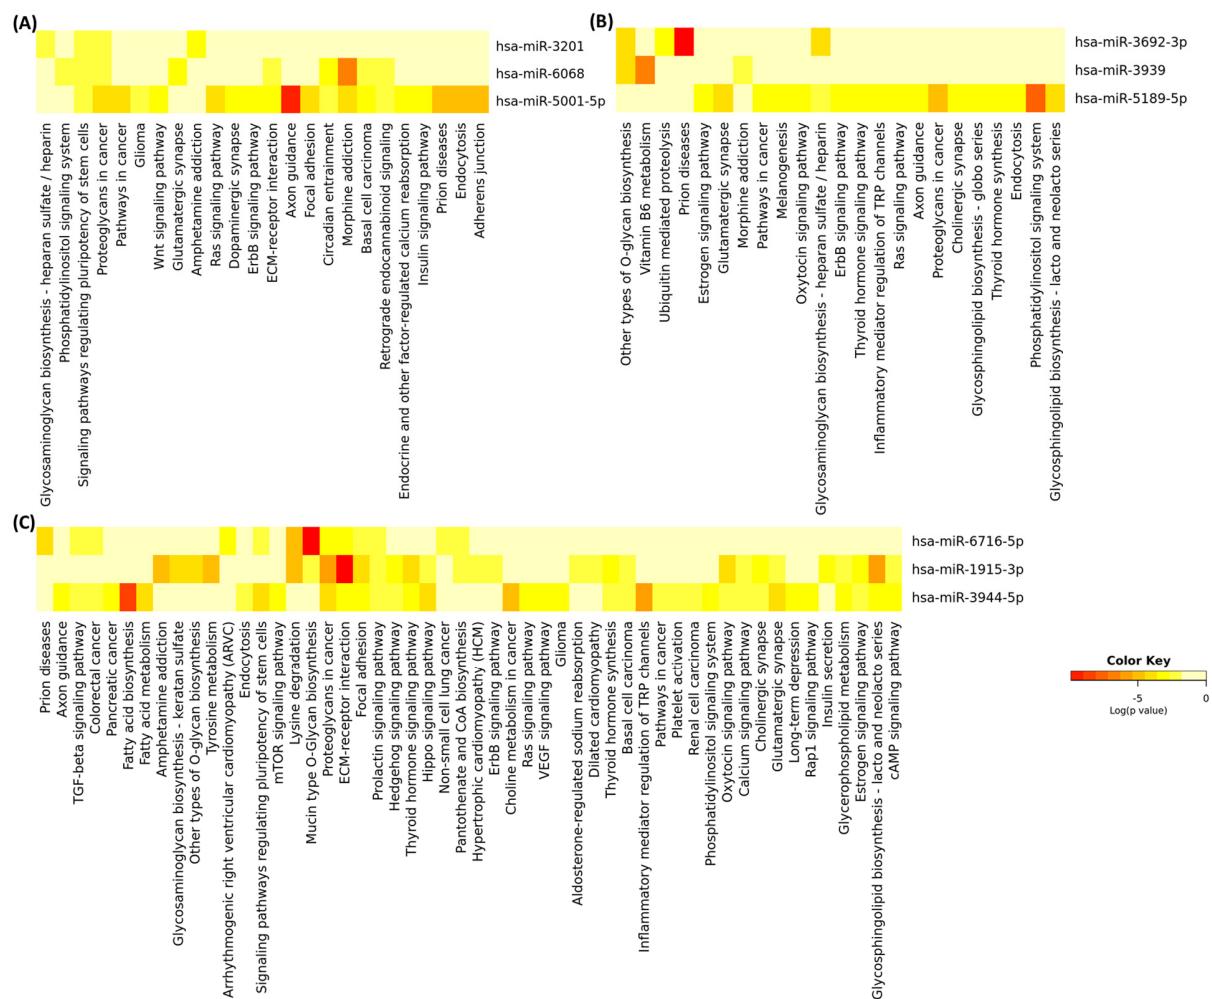

Figure S3: Overall survival analysis for prostate cancer patients with different clinicopathological features. Kaplan-Meier analysis shows no association between the tested parameters and the overall survival of PCa patients. The *p*-value was obtained by the log-rank test of the Kaplan-Meier curve.

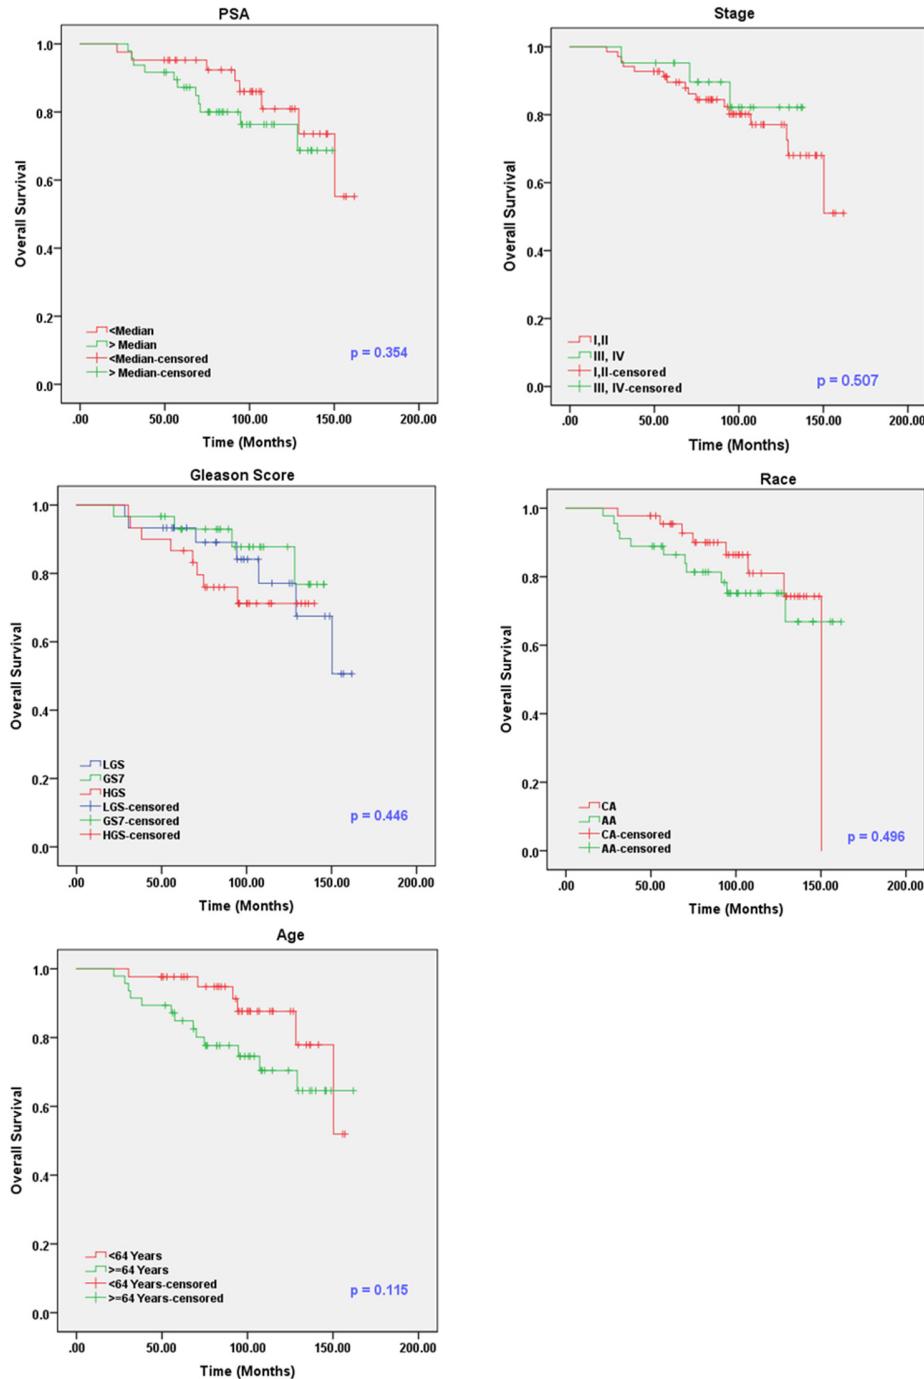

Figure S4. Recurrence-free survival analysis for prostate cancer patients with different clinicopathological features. Kaplan-Meier analysis shows no association between the tested parameters and the recurrence-free survival of PCa patients. The *p*-value was obtained by the log-rank test of the Kaplan-Meier curve.
